What is strict protection ?

COMMISSION STAFF WORKING DOCUMENT

Criteria and guidance for protected areas designations

« **Strictly protected areas are fully and legally protected areas** »

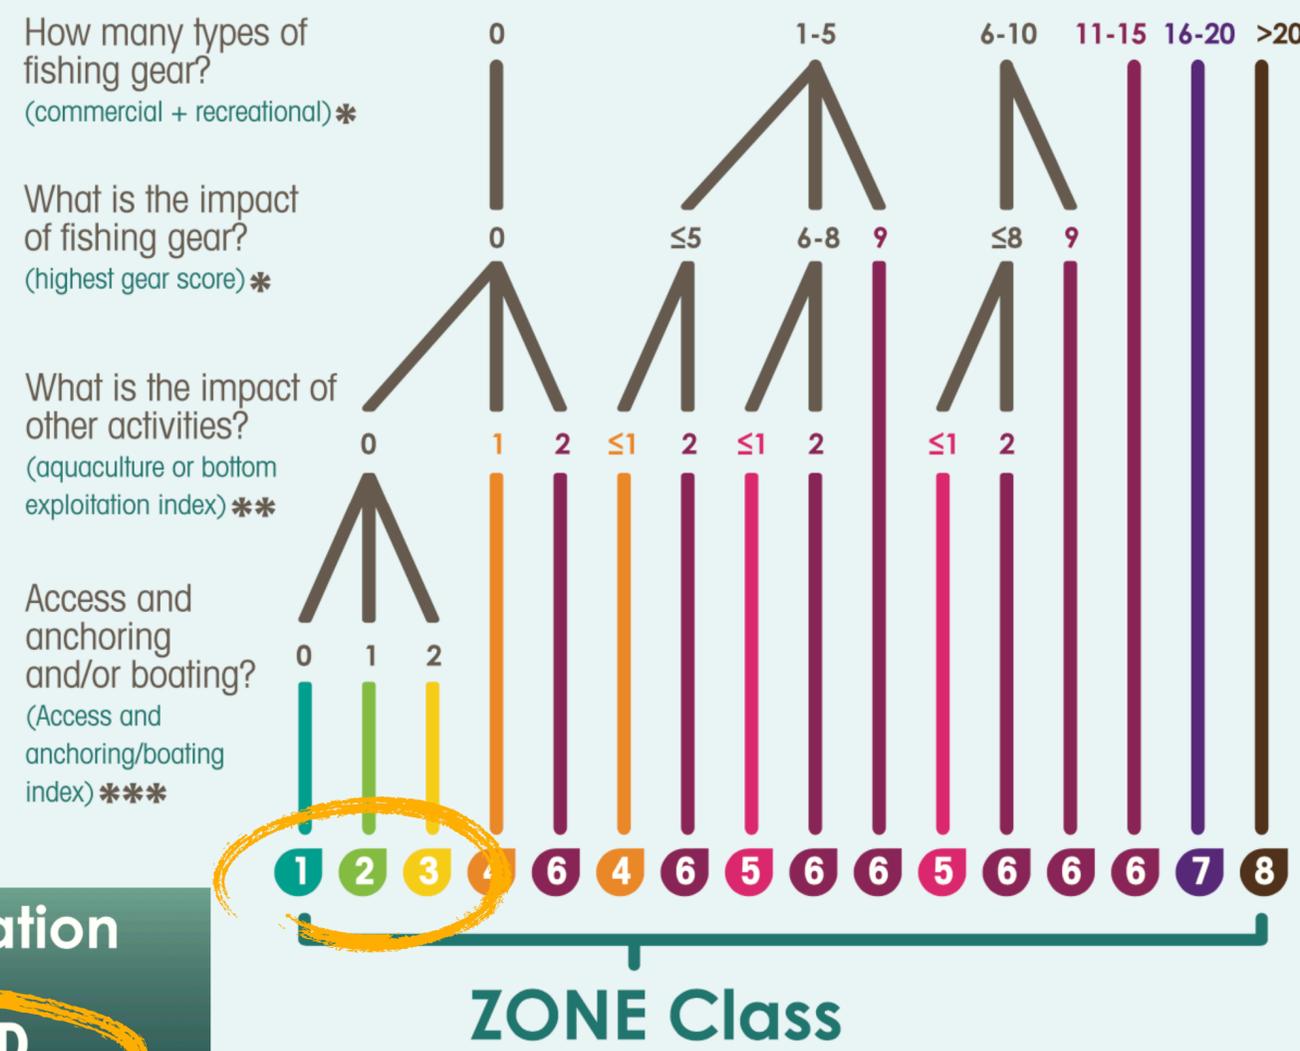

« **Strictly protected areas will be non-intervention areas where only limited and well-controlled activities [...] will be allowed, [...] such as non-intrusive and strictly controlled recreational activities** »

MPA index	MPA Classification
1 to 3 <small>incl.</small>	FULLY PROTECTED
3 to 5 <small>incl.</small>	HIGHLY PROTECTED
5 to 6 <small>incl.</small>	MODERATELY PROTECTED
6 to 7 <small>incl.</small>	POORLY PROTECTED
7 to 8	UNPROTECTED

A Regulation-Based Classification System for Marine Protected Areas (MPAs)

Based on: Horta e Costa et al. Marine Policy. DOI: <http://dx.doi.org/10.1016/j.marpol.2016.06.021>

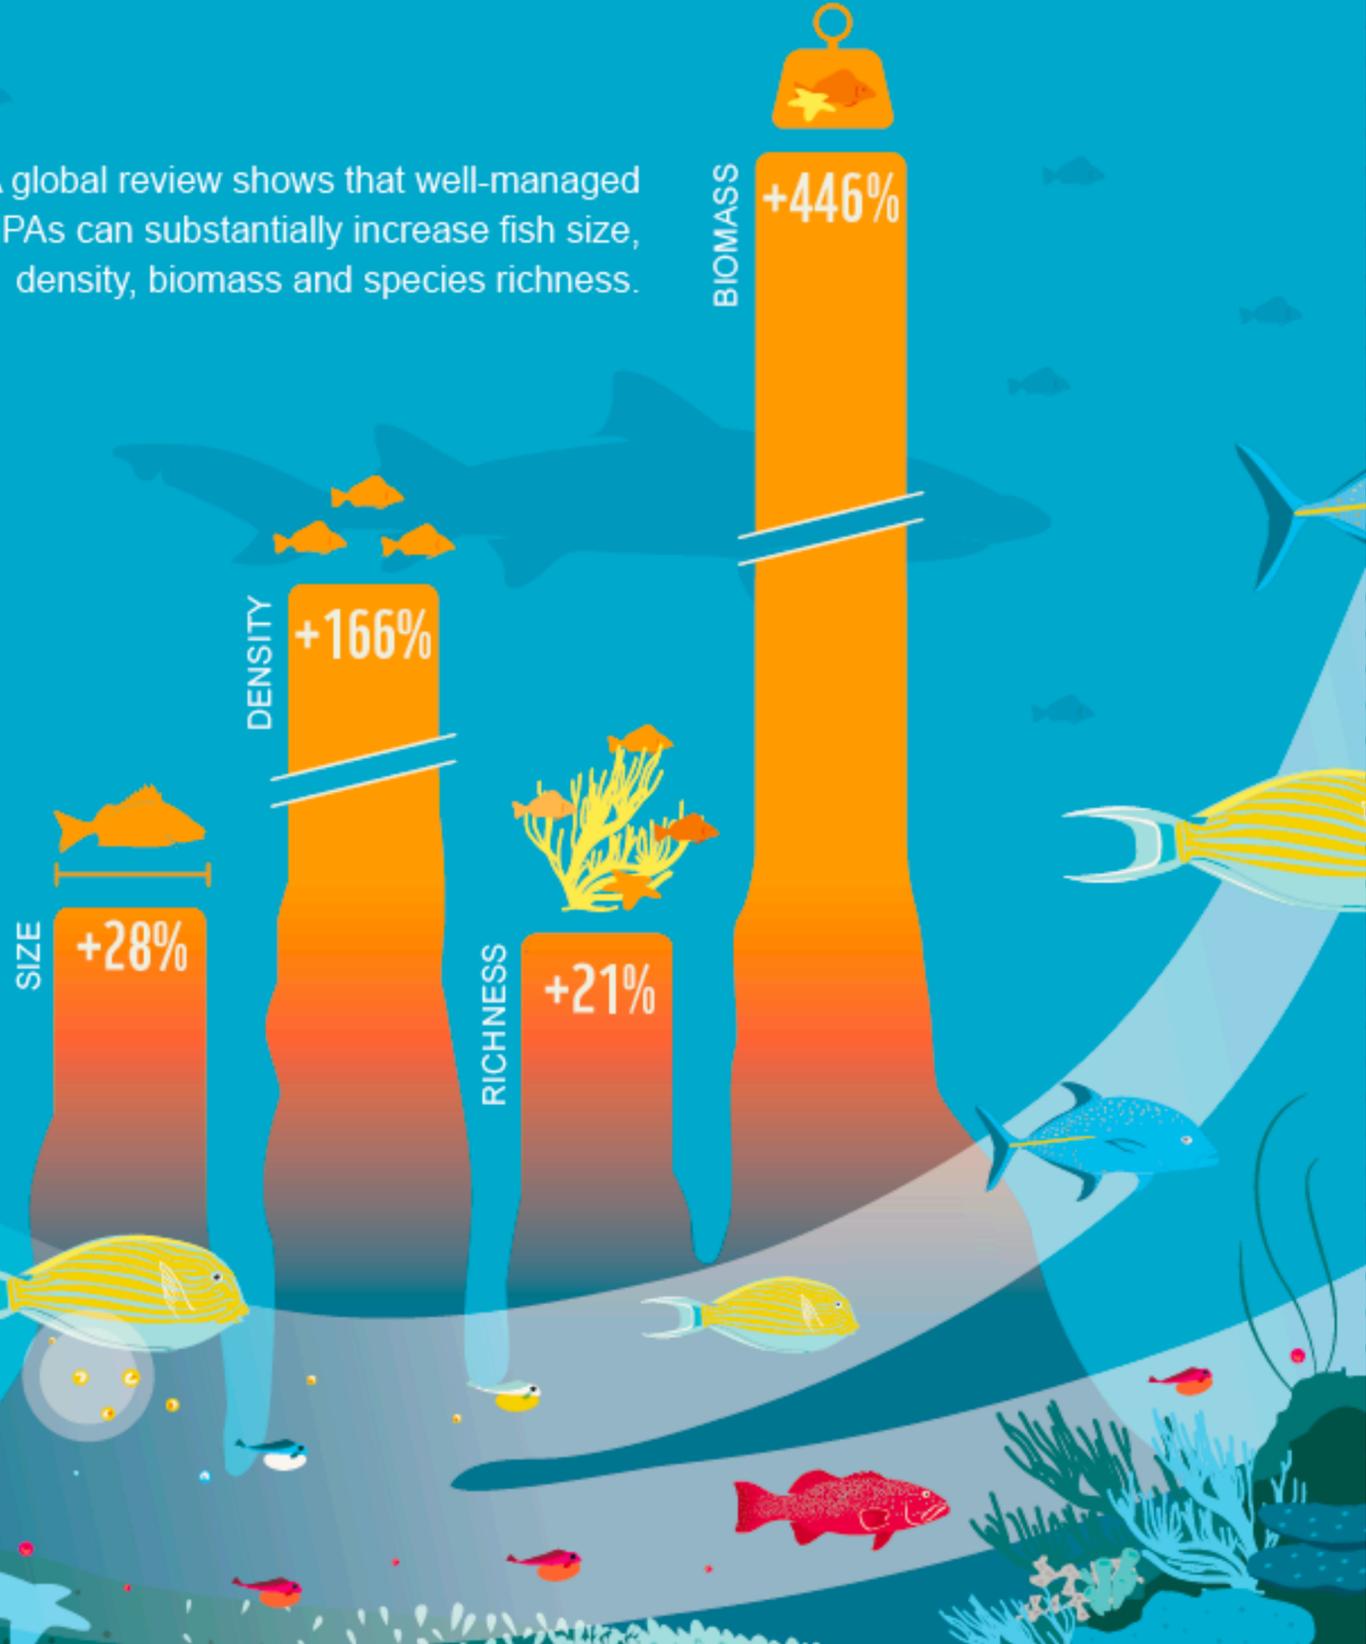

Classification System of Zones within MPAs (a decision tree)

Horta e Costa et al. 2016

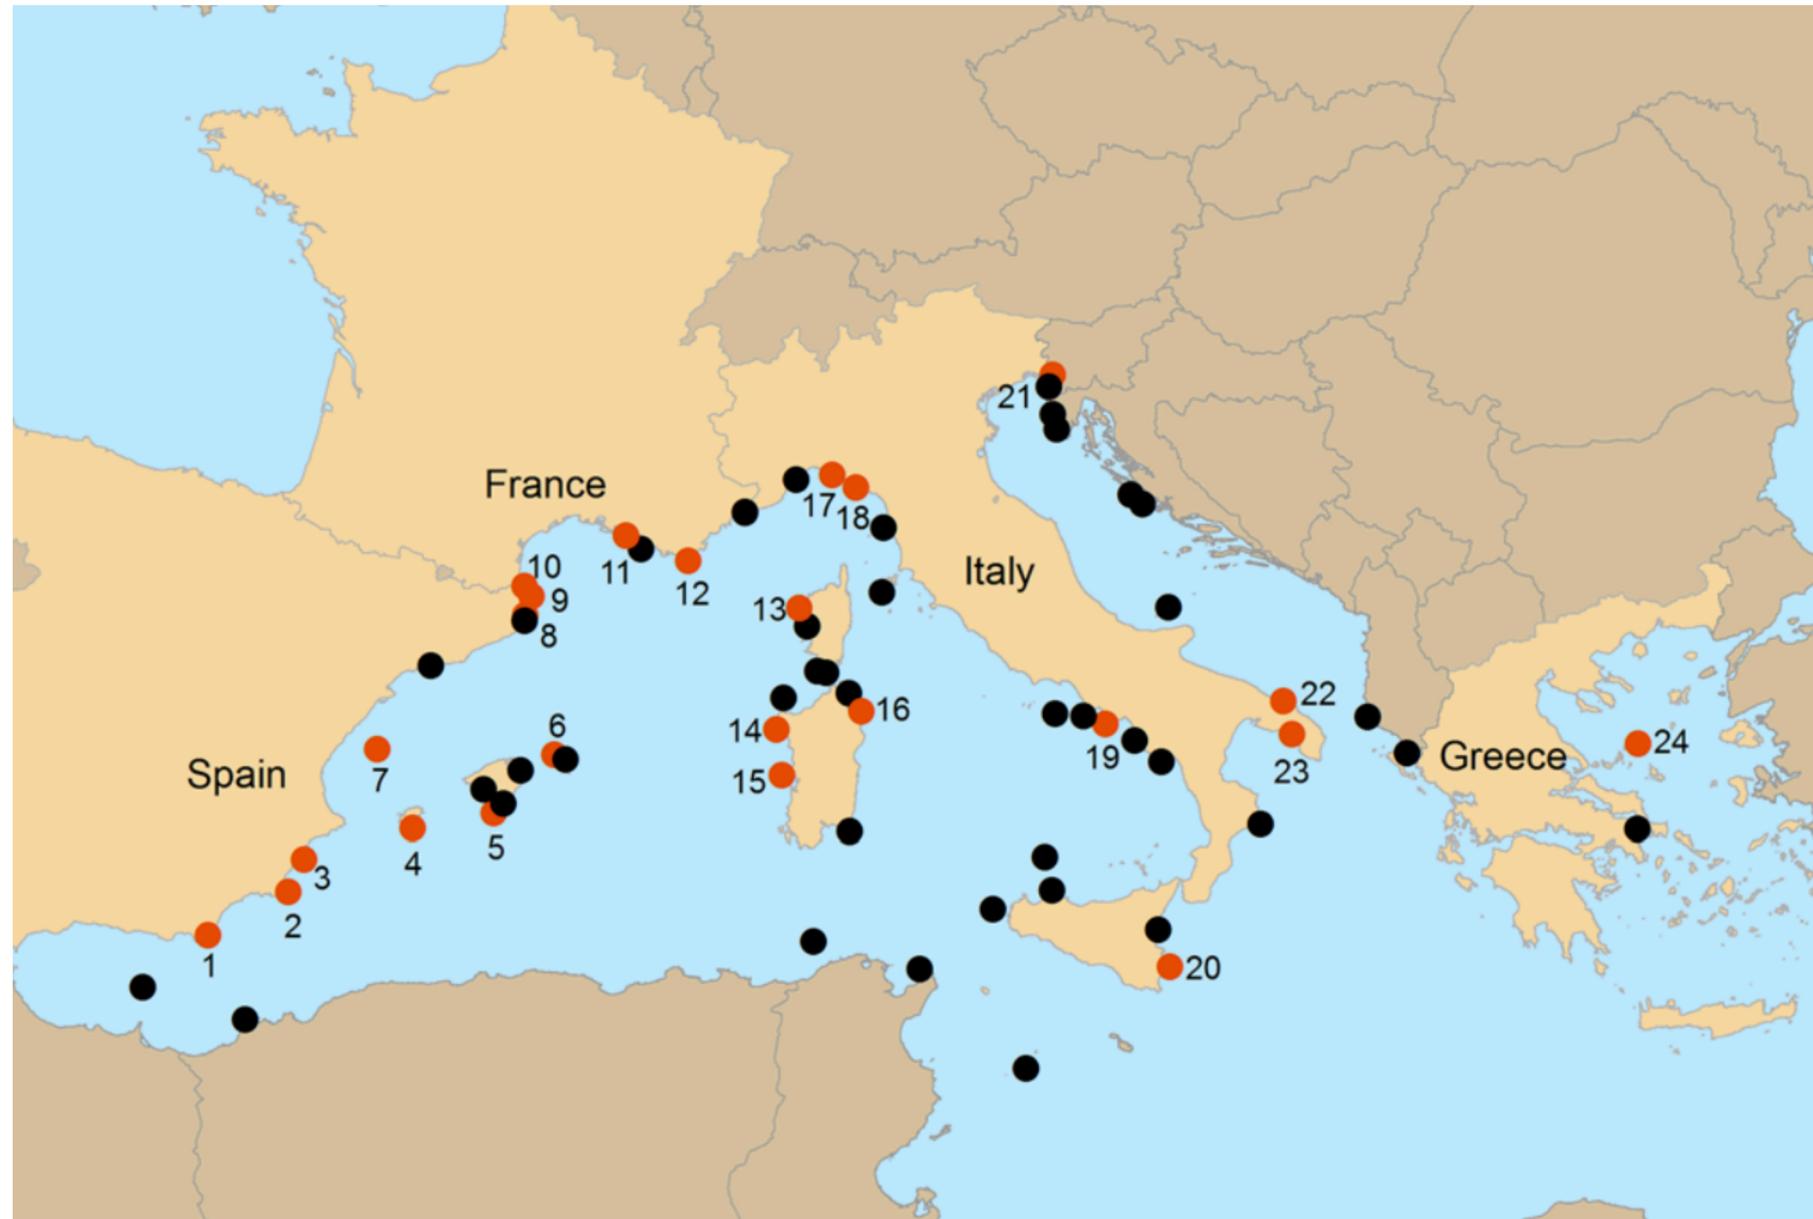

Benefits in fully protected MPAs

A global review shows that well-managed MPAs can substantially increase fish size, density, biomass and species richness.

Lester et al. 2007

Benefits in fully protected MPAs in the Mediterranean Sea

Giakoumi et al. 2017

In MPA with full protection (at least one zone) compared surrounding unprotected areas:

- x 2.3 greater total fish biomass
- x 1.4 greater total fish density

Benefits in fully protected MPAs

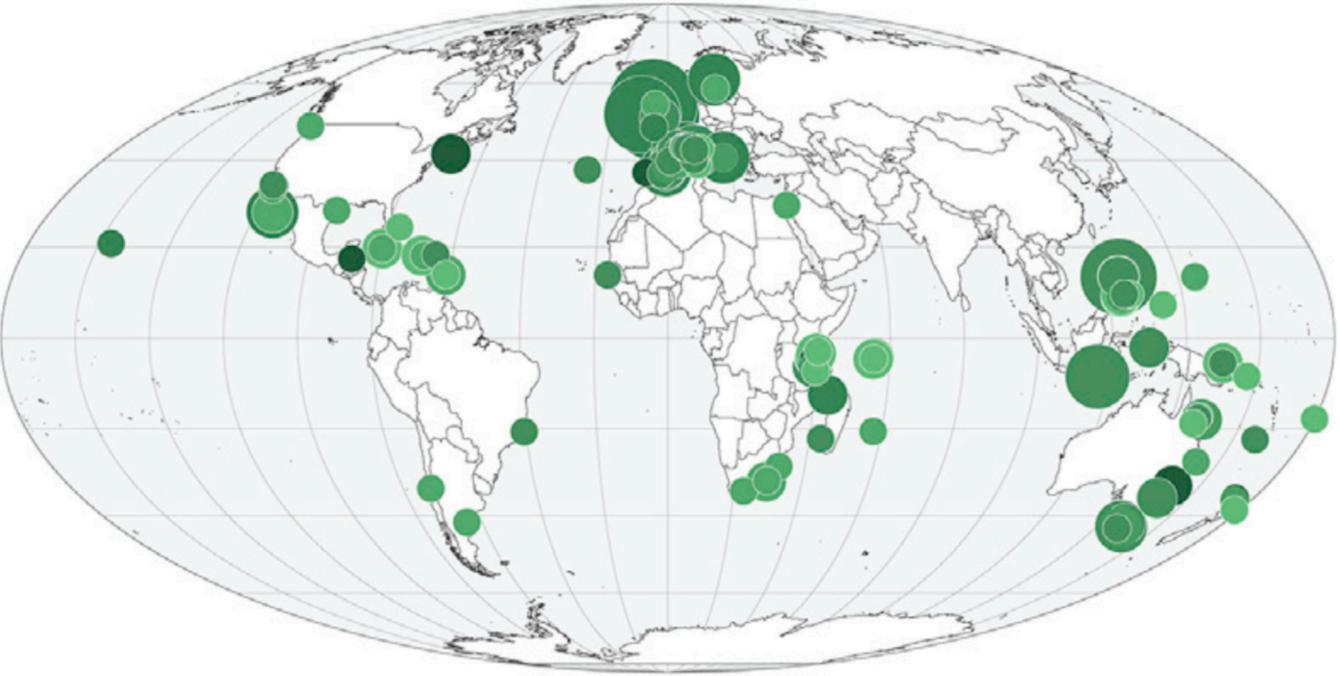

PROTECTION LEVEL

Jacquemont et al. 2022

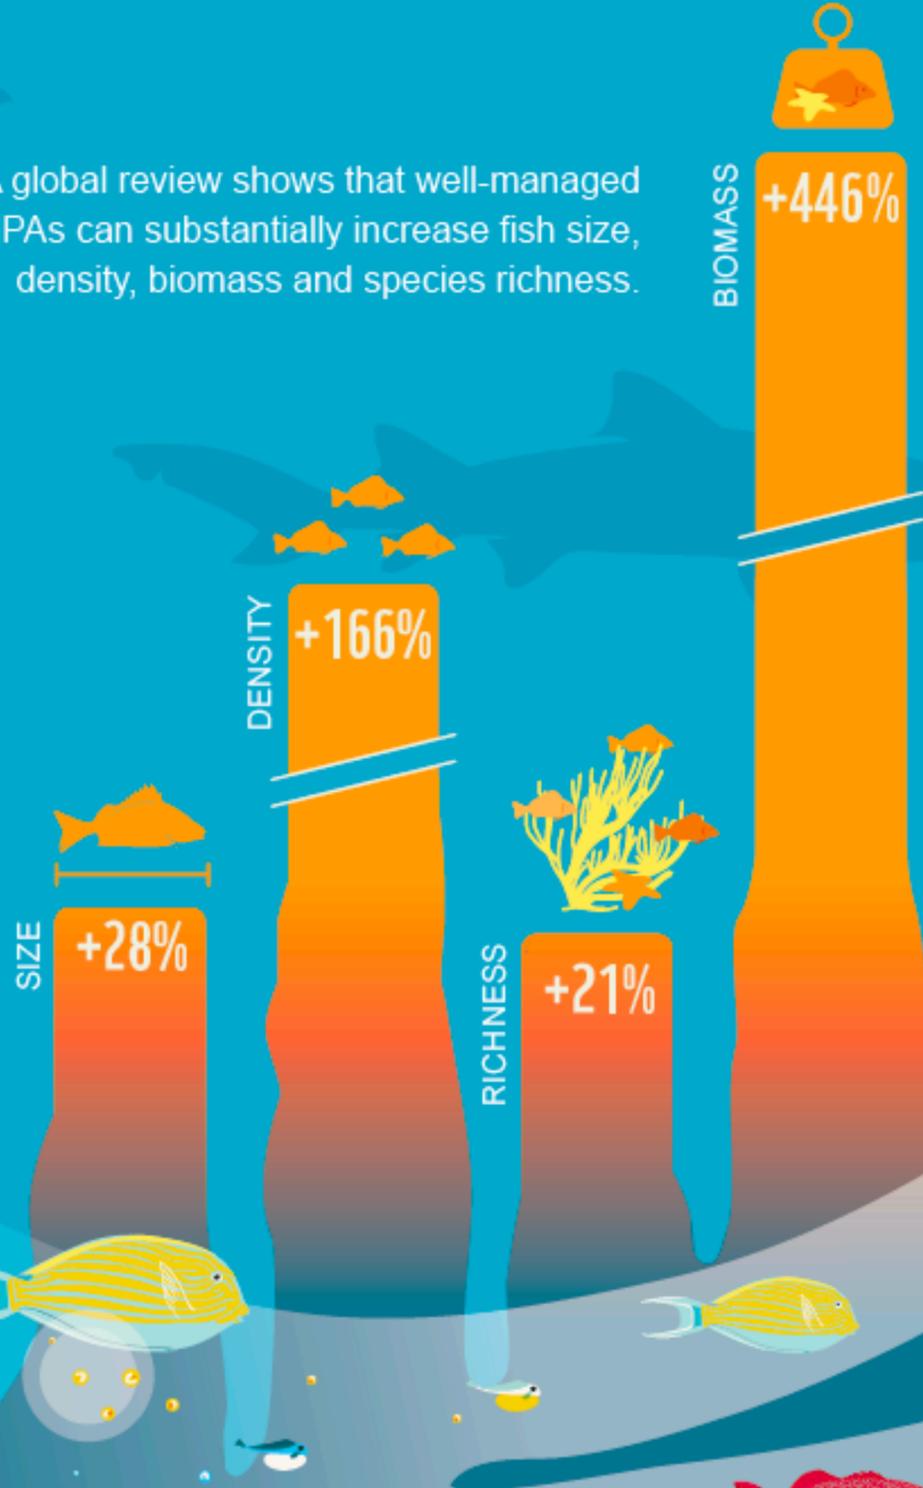

Positive effect of fully protected MPAs on:

- Biodiversity

Benefits export outside fully protected MPAs

A global review shows that well-managed MPAs can substantially increase fish size, density, biomass and species richness.

Lester et al. 2007

SPILLOVER

AND INVERTEBRATES

MPAs CAN PUMP FISH INTO ADJACENT AREAS

In Columbretes Islands MPA (Spain):

- Loss of fishing grounds: 32% of the area
- Number of lobsters caught: + 21%
- Biomass of lobsters caught: +41%

Goni et al. 2010

MPAs CAN EXPORT LARVAE INTO ADJACENT AREAS

DISPERSAL

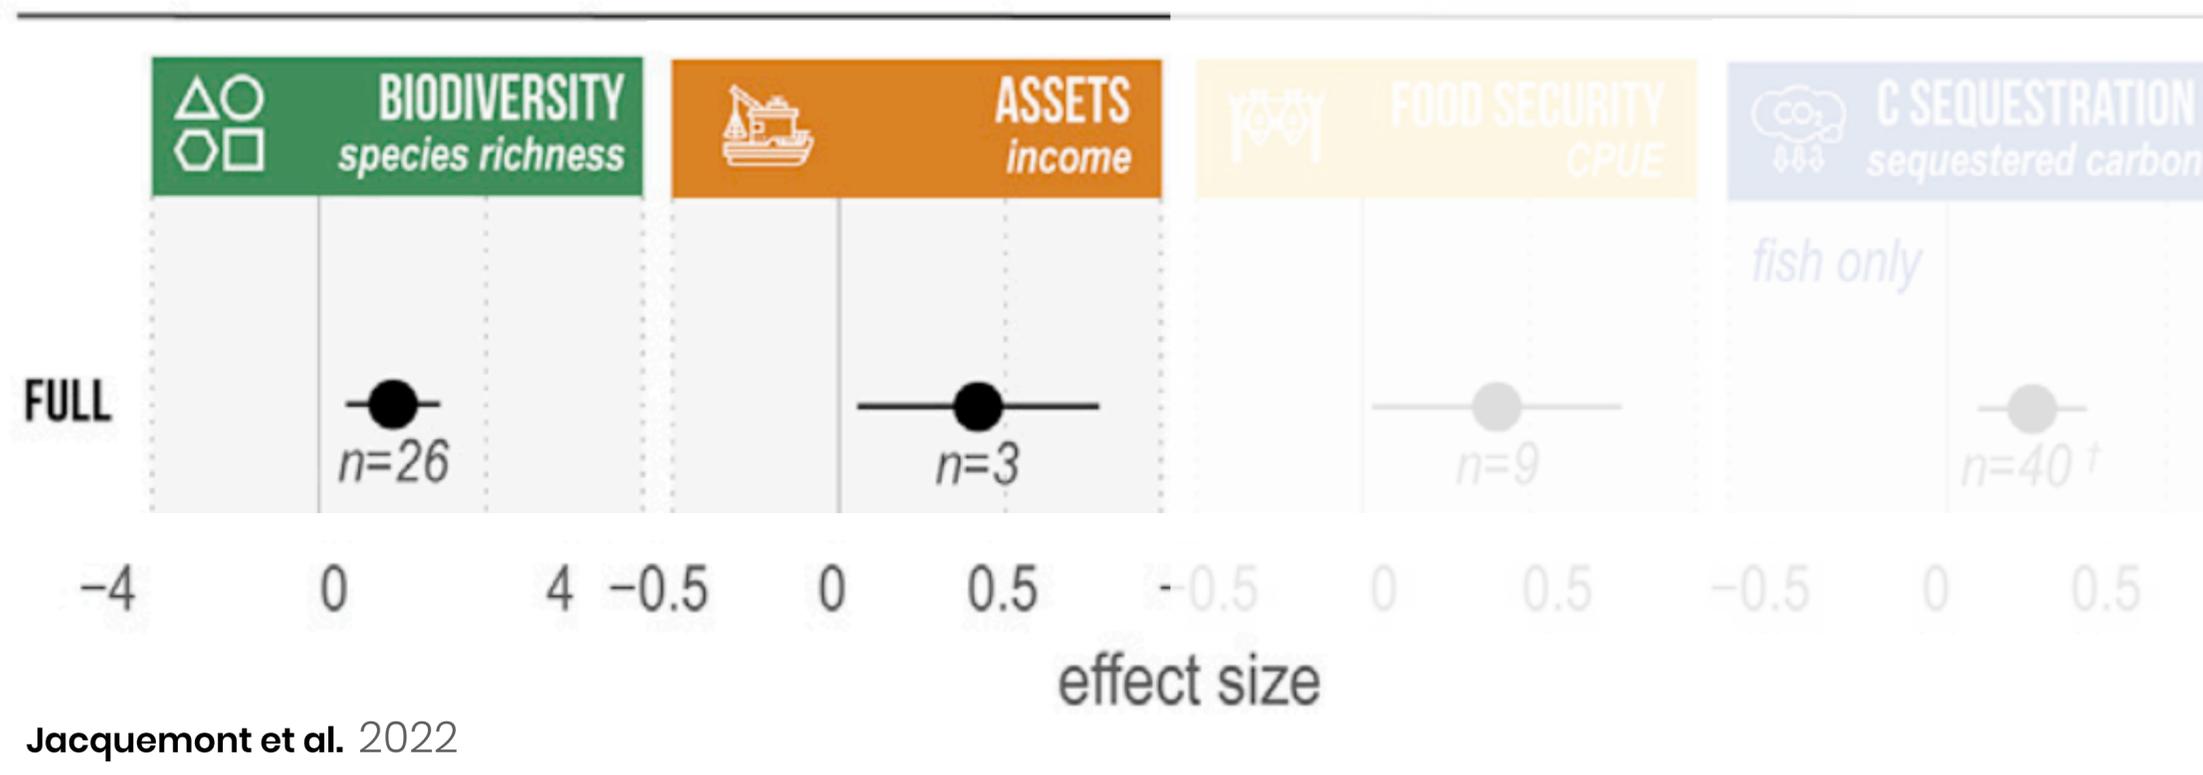

In Torre Guaceto MPA (Italy)

Large seabreams in the fully protected area produce eggs and larvae that disperse to fished areas more than 100 km away.

Di Franco et al. 2012

Multiple socio-ecological benefits of fully protected MPAs

PROTECTION LEVEL

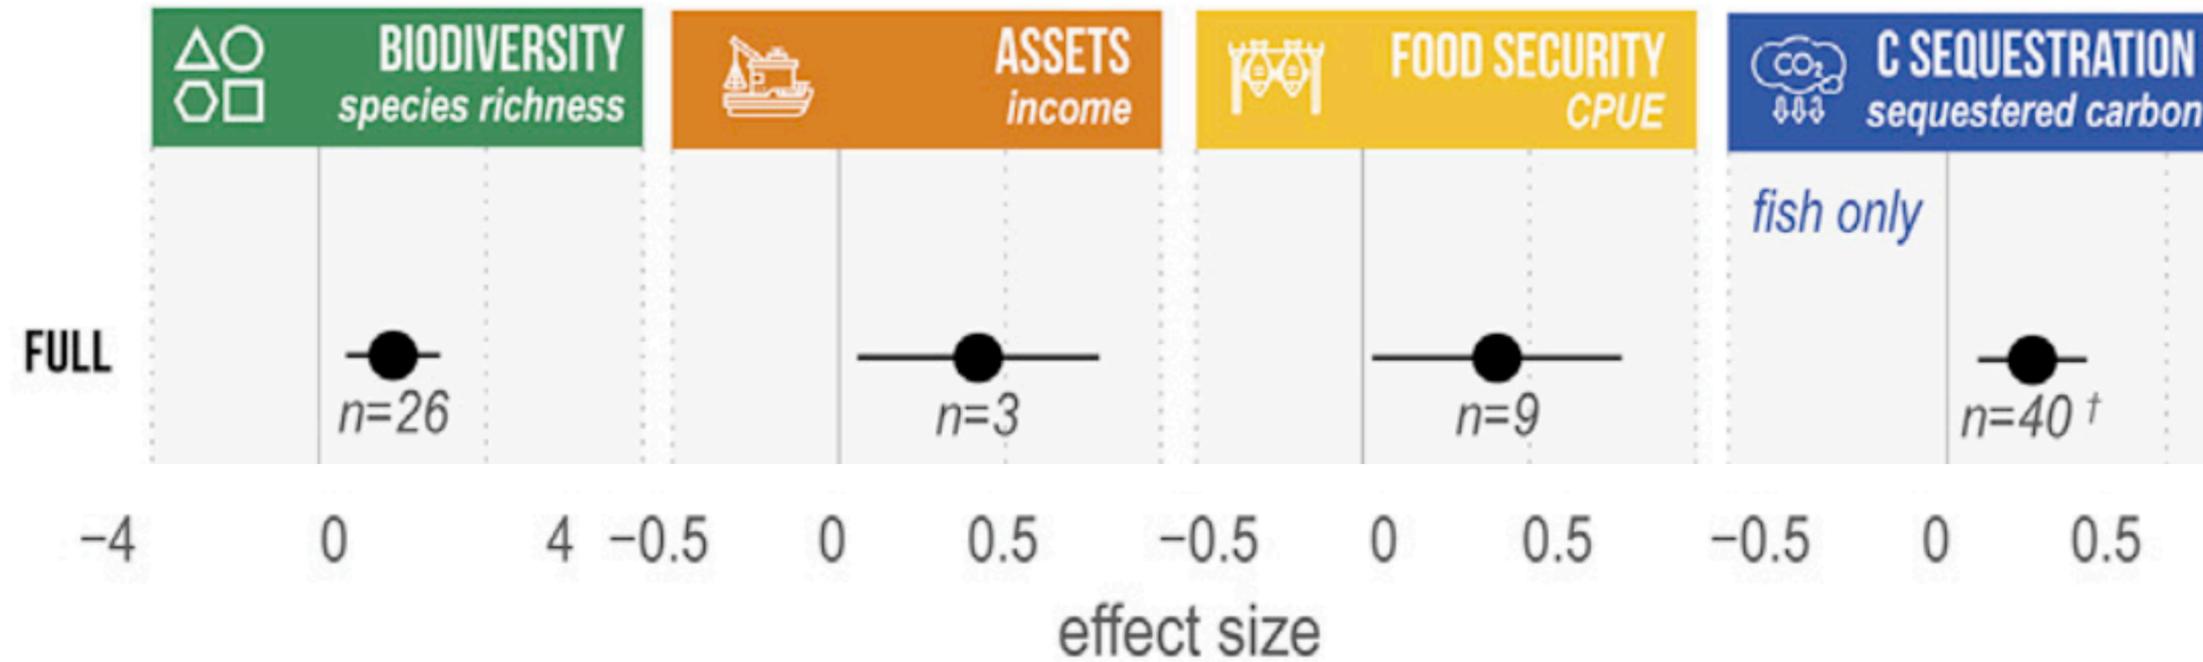

Positive effect of fully protected MPAs on:

- Biodiversity
- Income for fishermen

Multiple socio-ecological benefits of fully protected MPAs

PROTECTION LEVEL

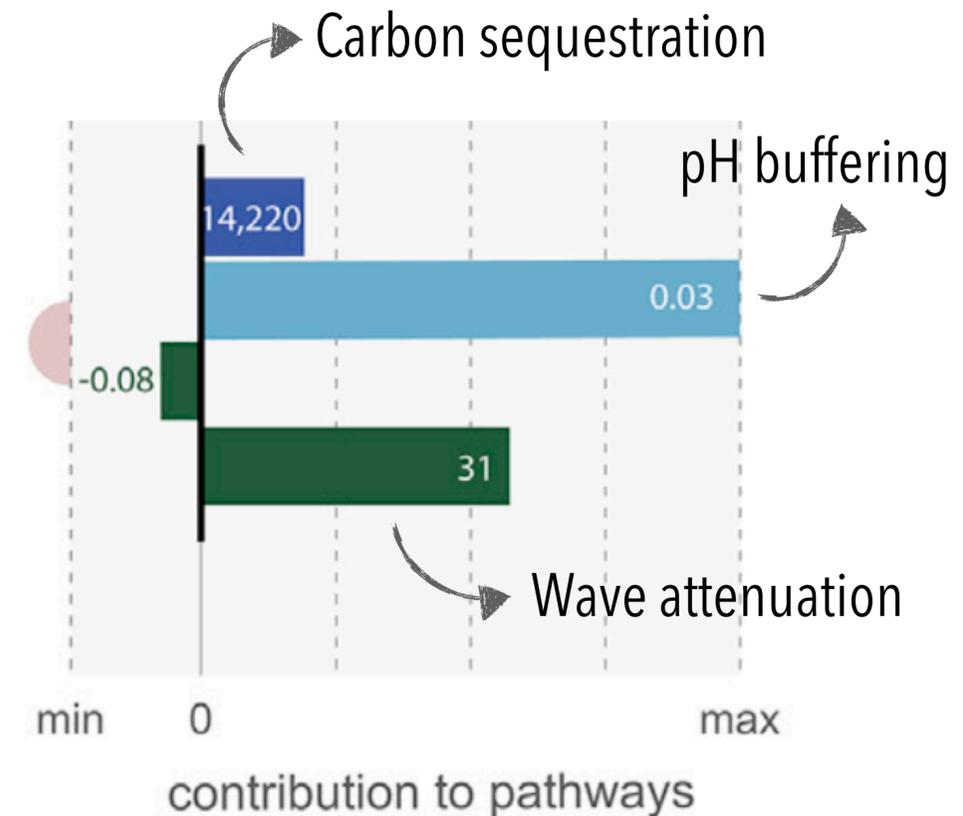

Jacquemont et al. 2022

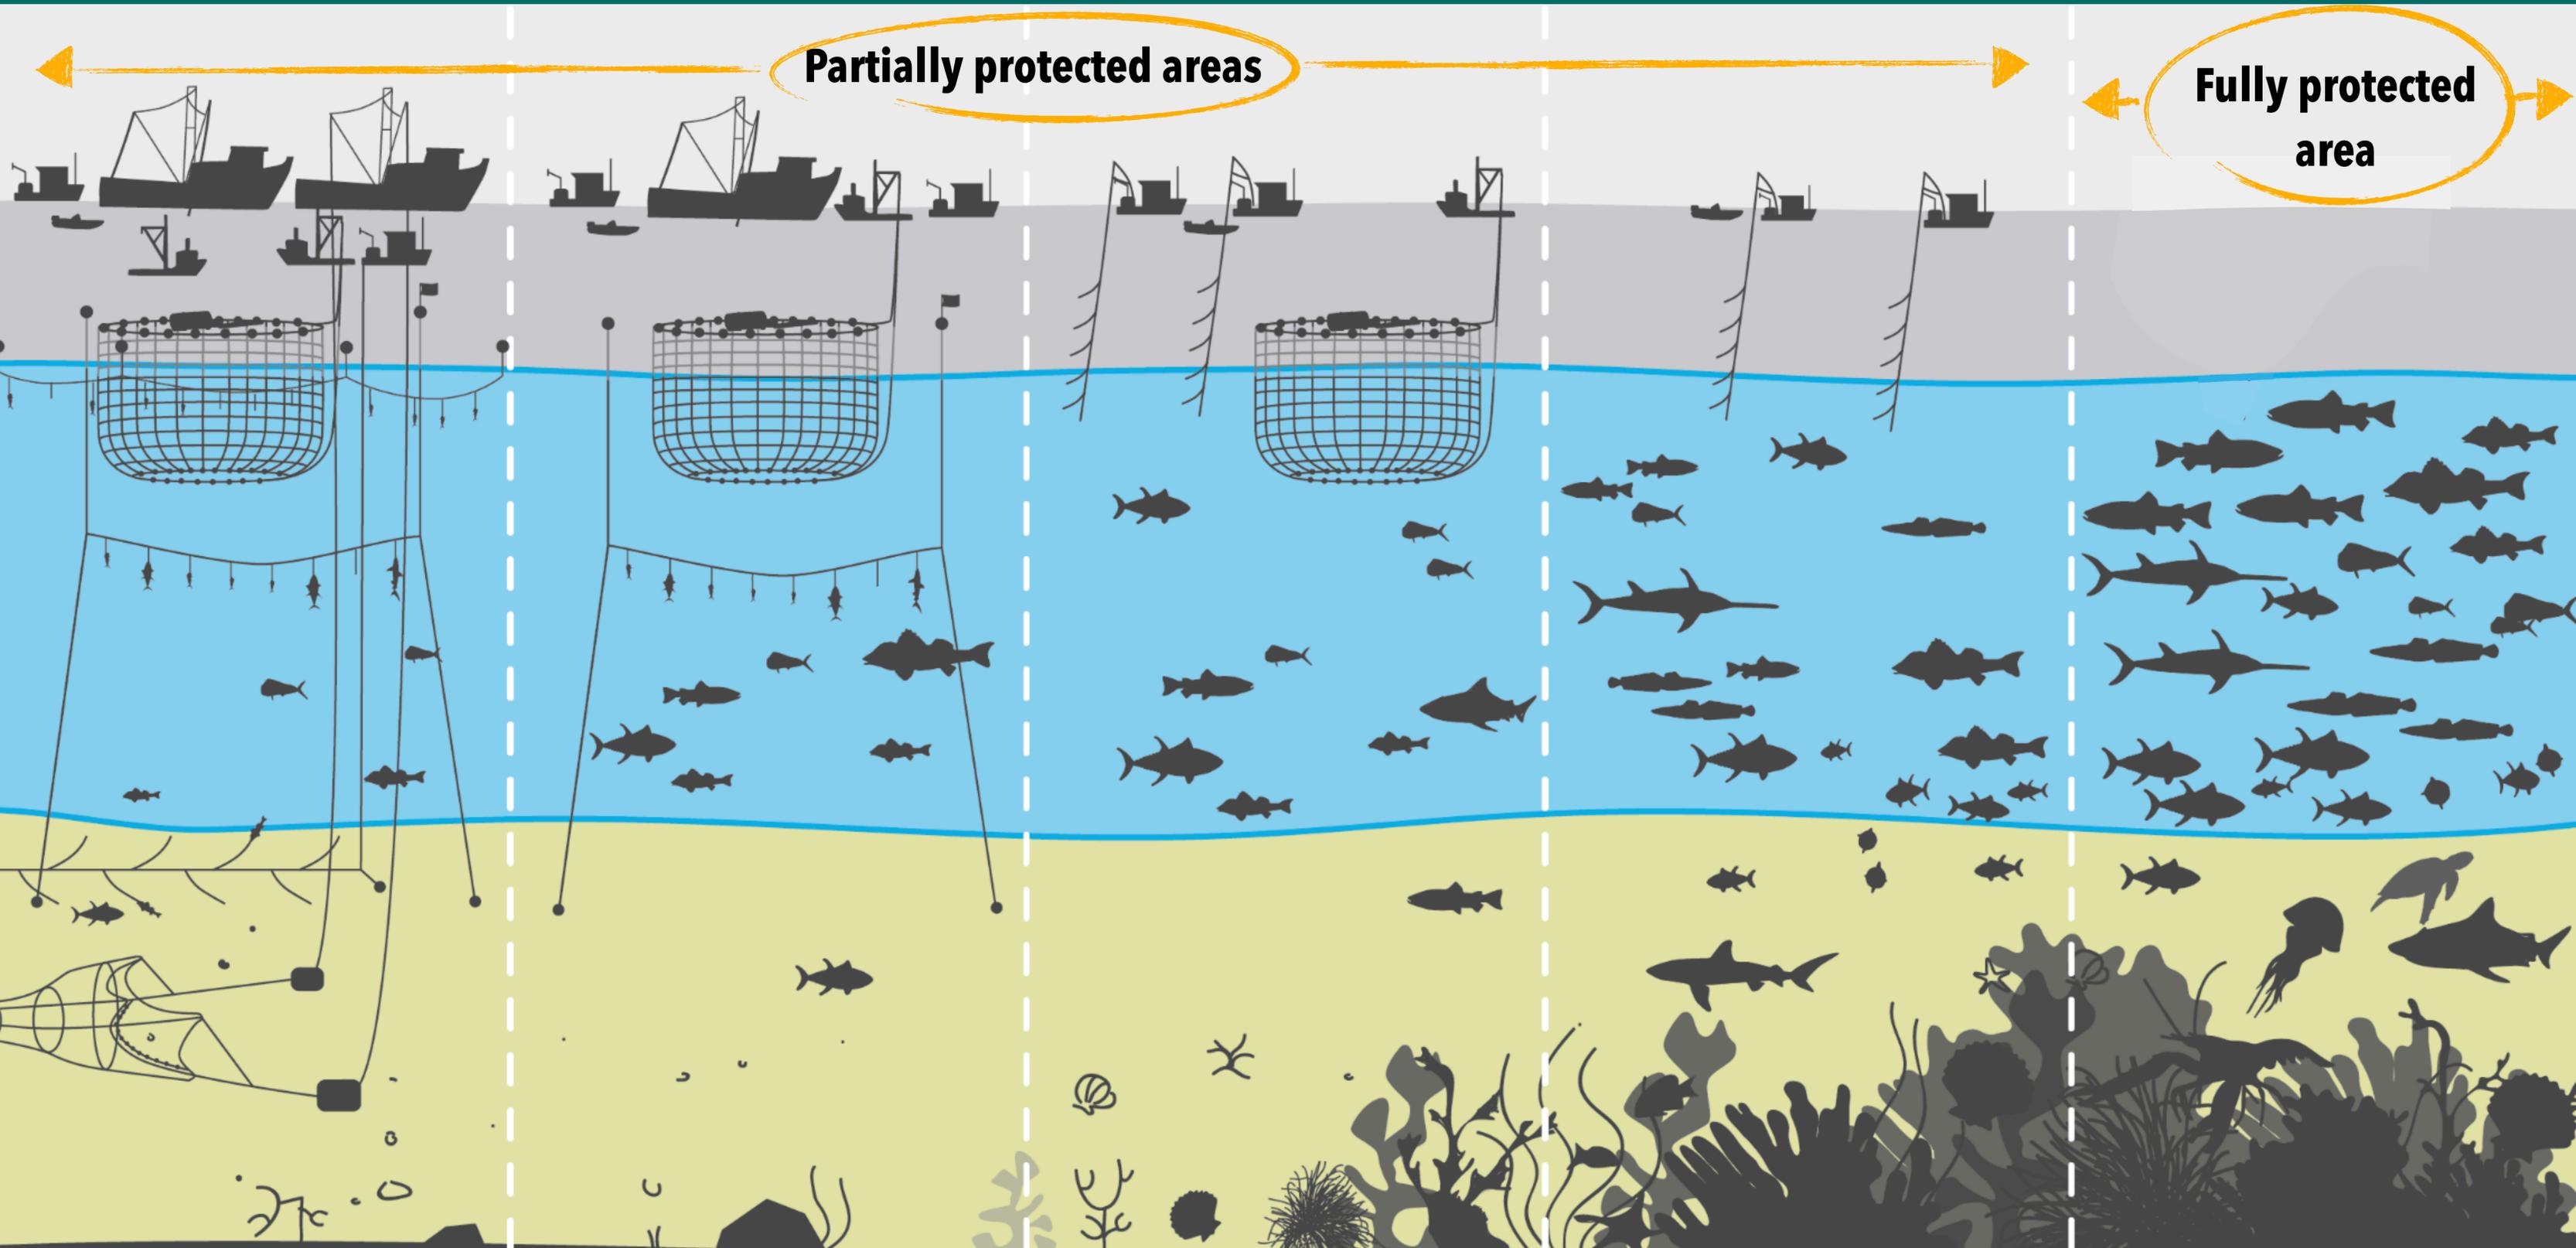

Positive effect of fully protected MPAs on:

- Biodiversity
- Income for fishermen
- Foods security through an increase in catch per unit of effort
- Climate change mitigation through different pathways

Seagrass (266,562 km²)

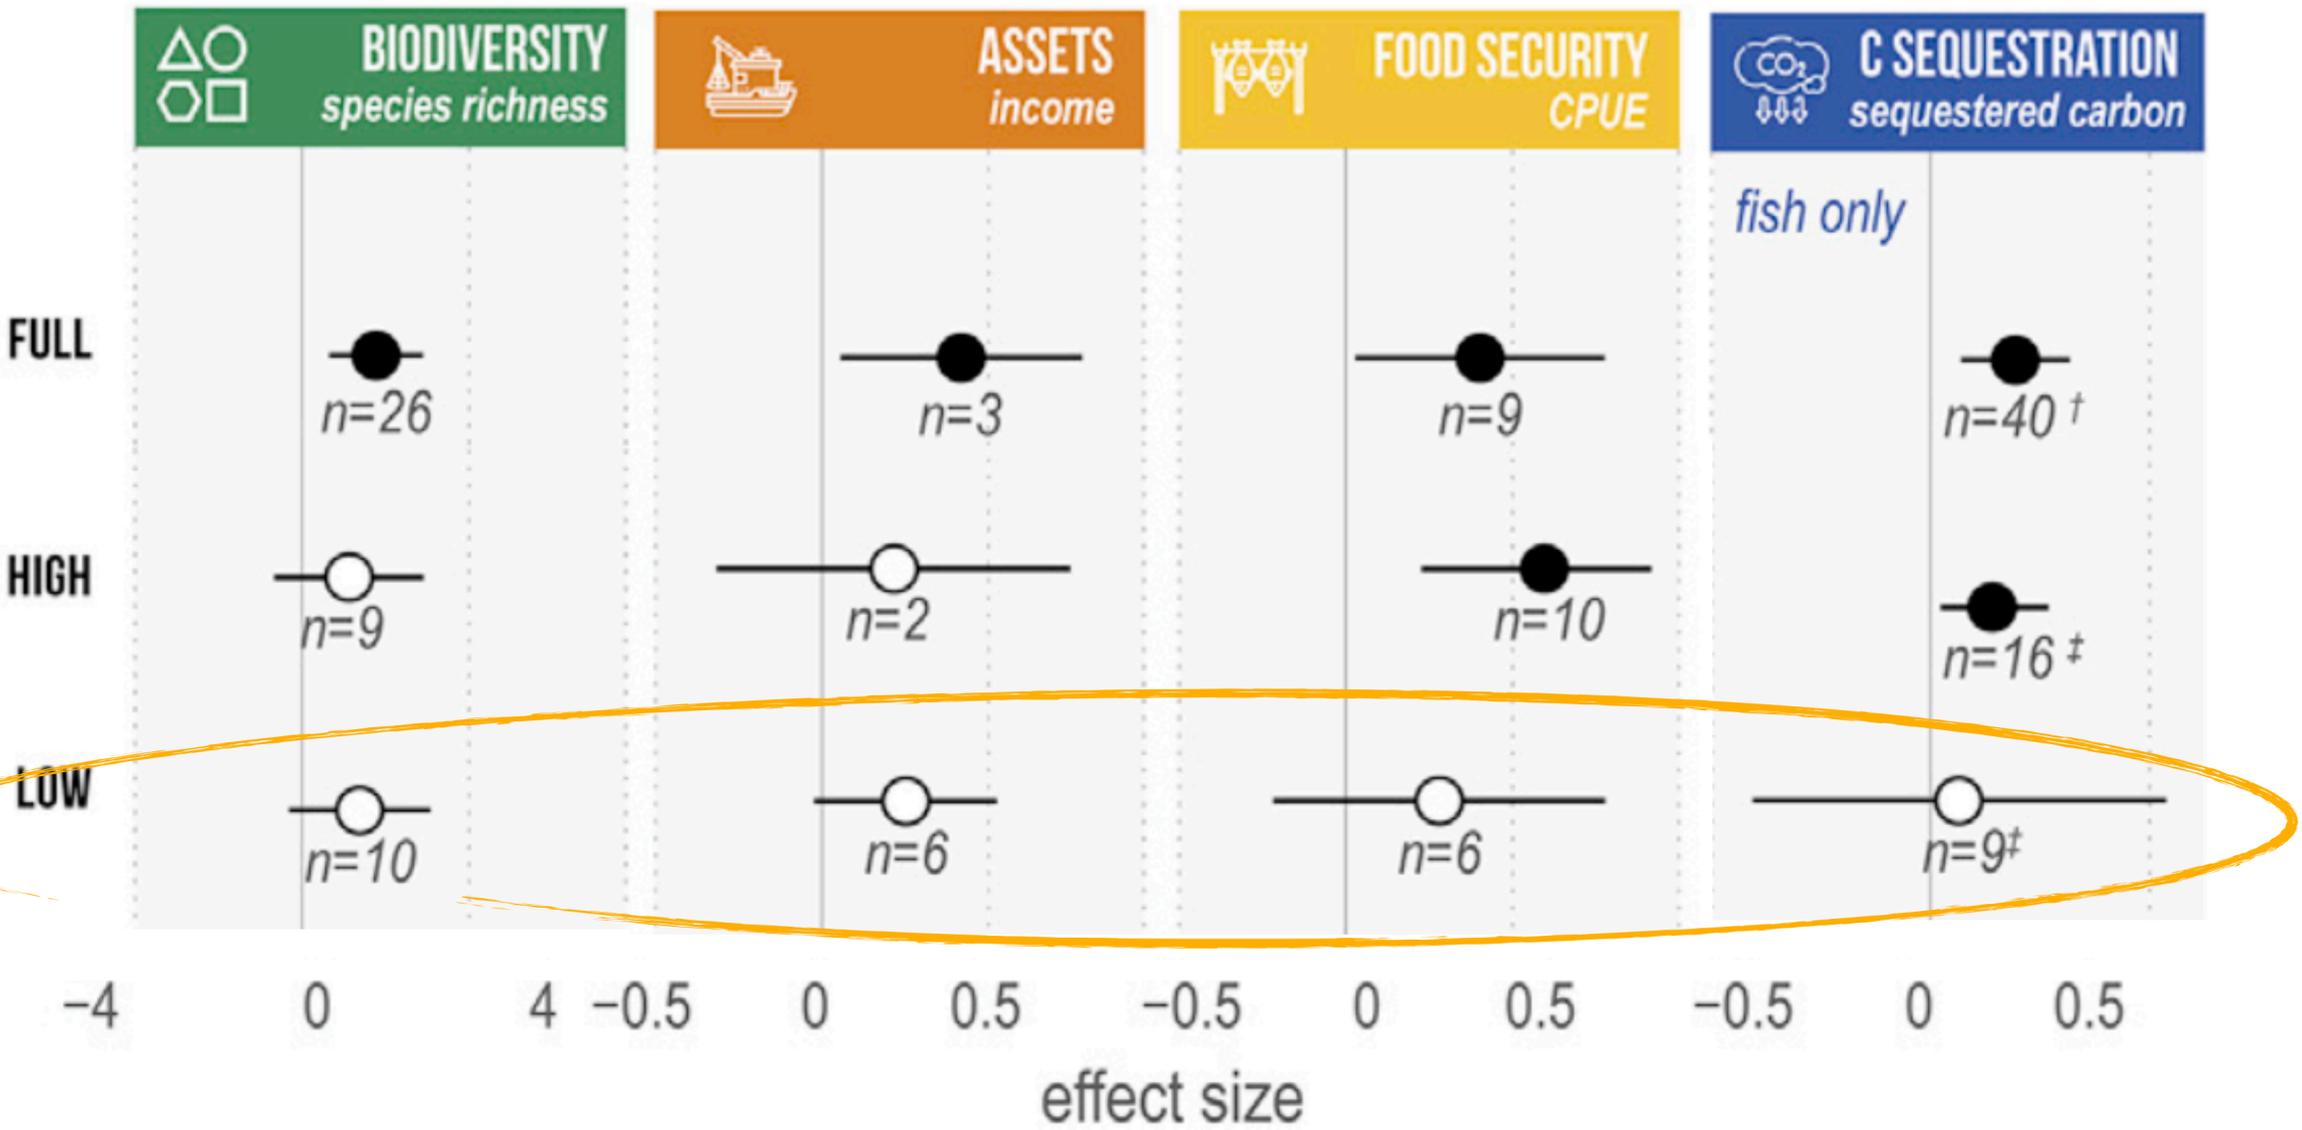

Marine Protected Areas are far from being all fully protected

What about not fully protected MPAs ?

PROTECTION LEVEL

When MPAs don't implement regulations allowing the reduction of human pressures on ecosystem components, no socio-ecological benefits are expected

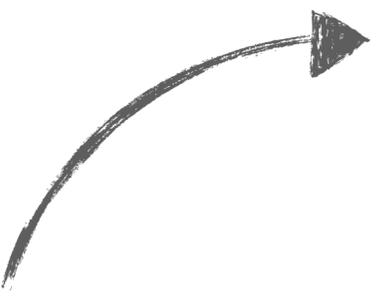

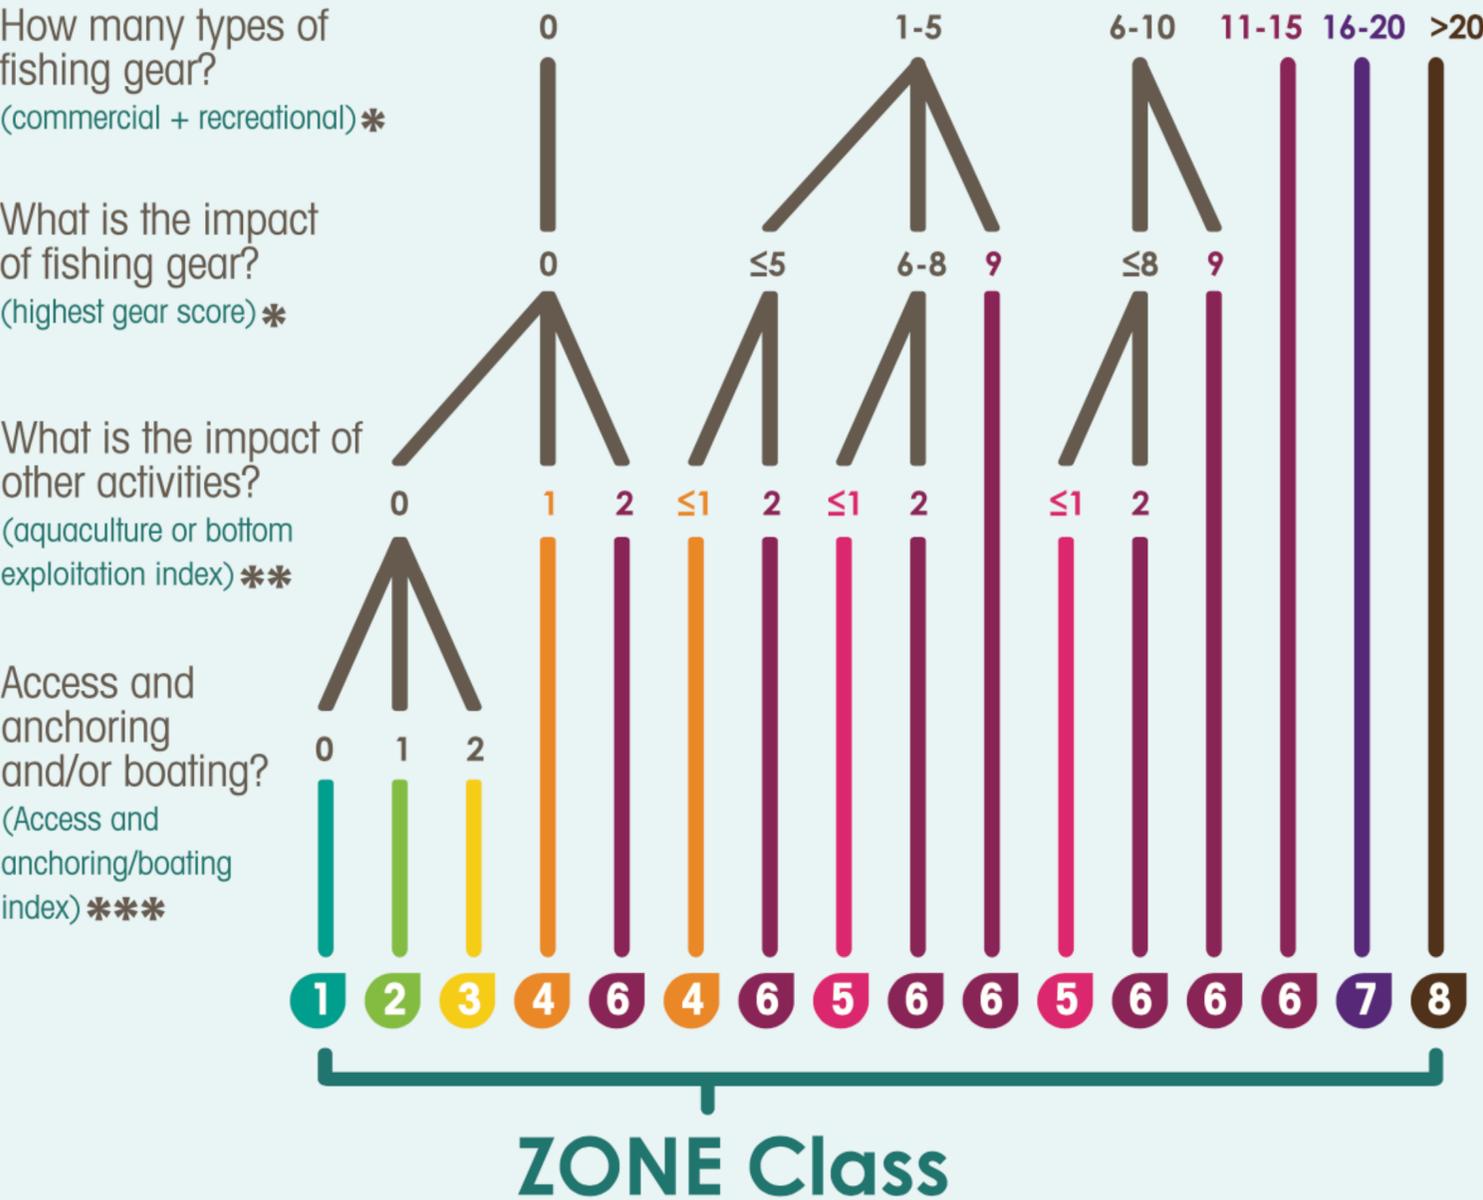

Jacquemont et al. 2022

A MPA classification based on their regulations

A Regulation-Based Classification System for Marine Protected Areas (MPAs)

Based on: Horta e Costa et al. Marine Policy. DOI: <http://dx.doi.org/10.1016/j.marpol.2016.06.021>

Classification System of Zones within MPAs (a decision tree)

A Regulation-Based Classification System for Marine Protected Areas (MPAs)

Based on: Horta e Costa et al. Marine Policy. DOI: <http://dx.doi.org/10.1016/j.marpol.2016.06.021>

Classification System of MPAs

ZONE Class **1 2 3 4 6 4 6 5 6 6 5 6 6 6 7 8**

Next stage: how to classify MPAs

An MPA index is calculated based on the area each ZONE Class occupies within the MPA

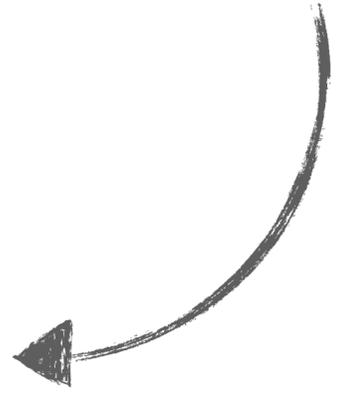

$$\text{MPA index} = \text{SUM} \left(\text{ZONE}_i \text{ Class} \times \frac{\text{Area ZONE}_i}{\text{Area MPA}} \right)$$

Example of a multiple-use MPA with 3 zones (and corresponding zone classes) occupying different areas

EXAMPLE
MPA with 100 ha of total area
15ha class 1 + 35ha class 5 + 50ha class 8
MPA index = $(1 \times \frac{15}{100}) + (5 \times \frac{35}{100}) + (8 \times \frac{50}{100}) = 5.9$

MPA index	MPA Classification
1 to 3 <i>incl.</i>	FULLY PROTECTED
3 to 5 <i>incl.</i>	HIGHLY PROTECTED
5 to 6 <i>incl.</i>	MODERATELY PROTECTED
6 to 7 <i>incl.</i>	POORLY PROTECTED
7 to 8	UNPROTECTED

In Brief

While the ocean is central to human well-being, an expanding human footprint is placing it at risk. Among the 1,062 marine protected areas in the Mediterranean Sea, 72% of the protected areas lack regulations that can reduce human impacts on biodiversity. The most effective levels of protection represent only 0.23% of the basin. Protection levels should be increased and more evenly distributed across political boundaries and eco-regions to deliver tangible benefits for biodiversity conservation.

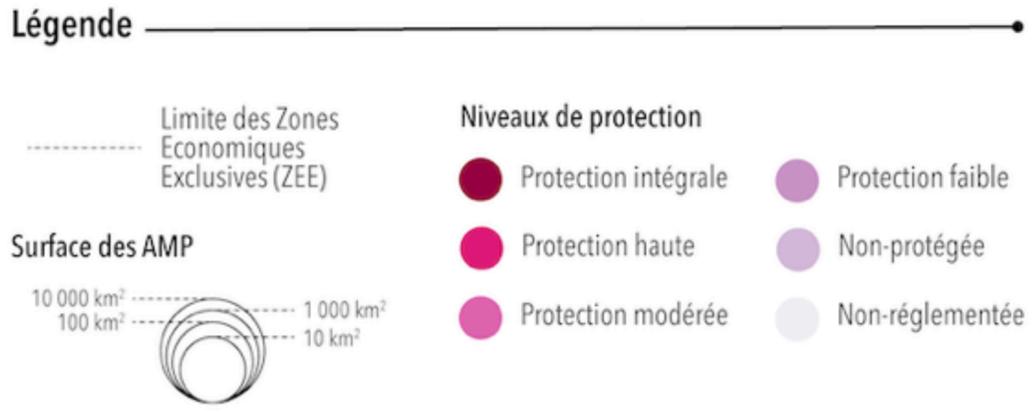

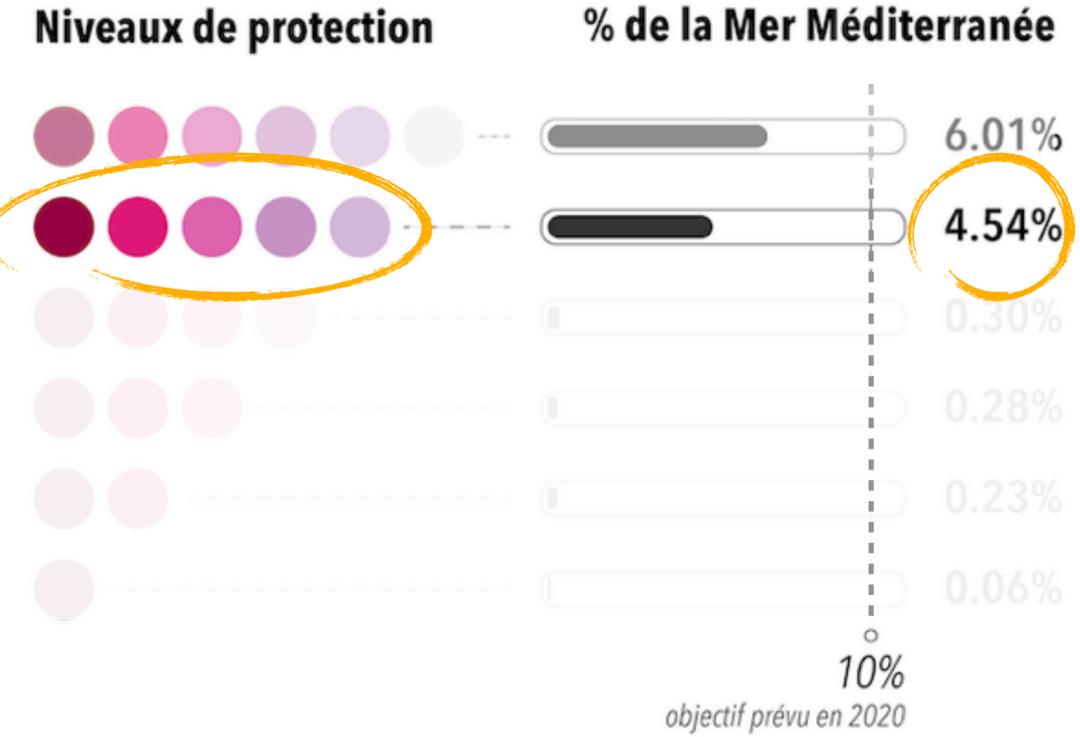

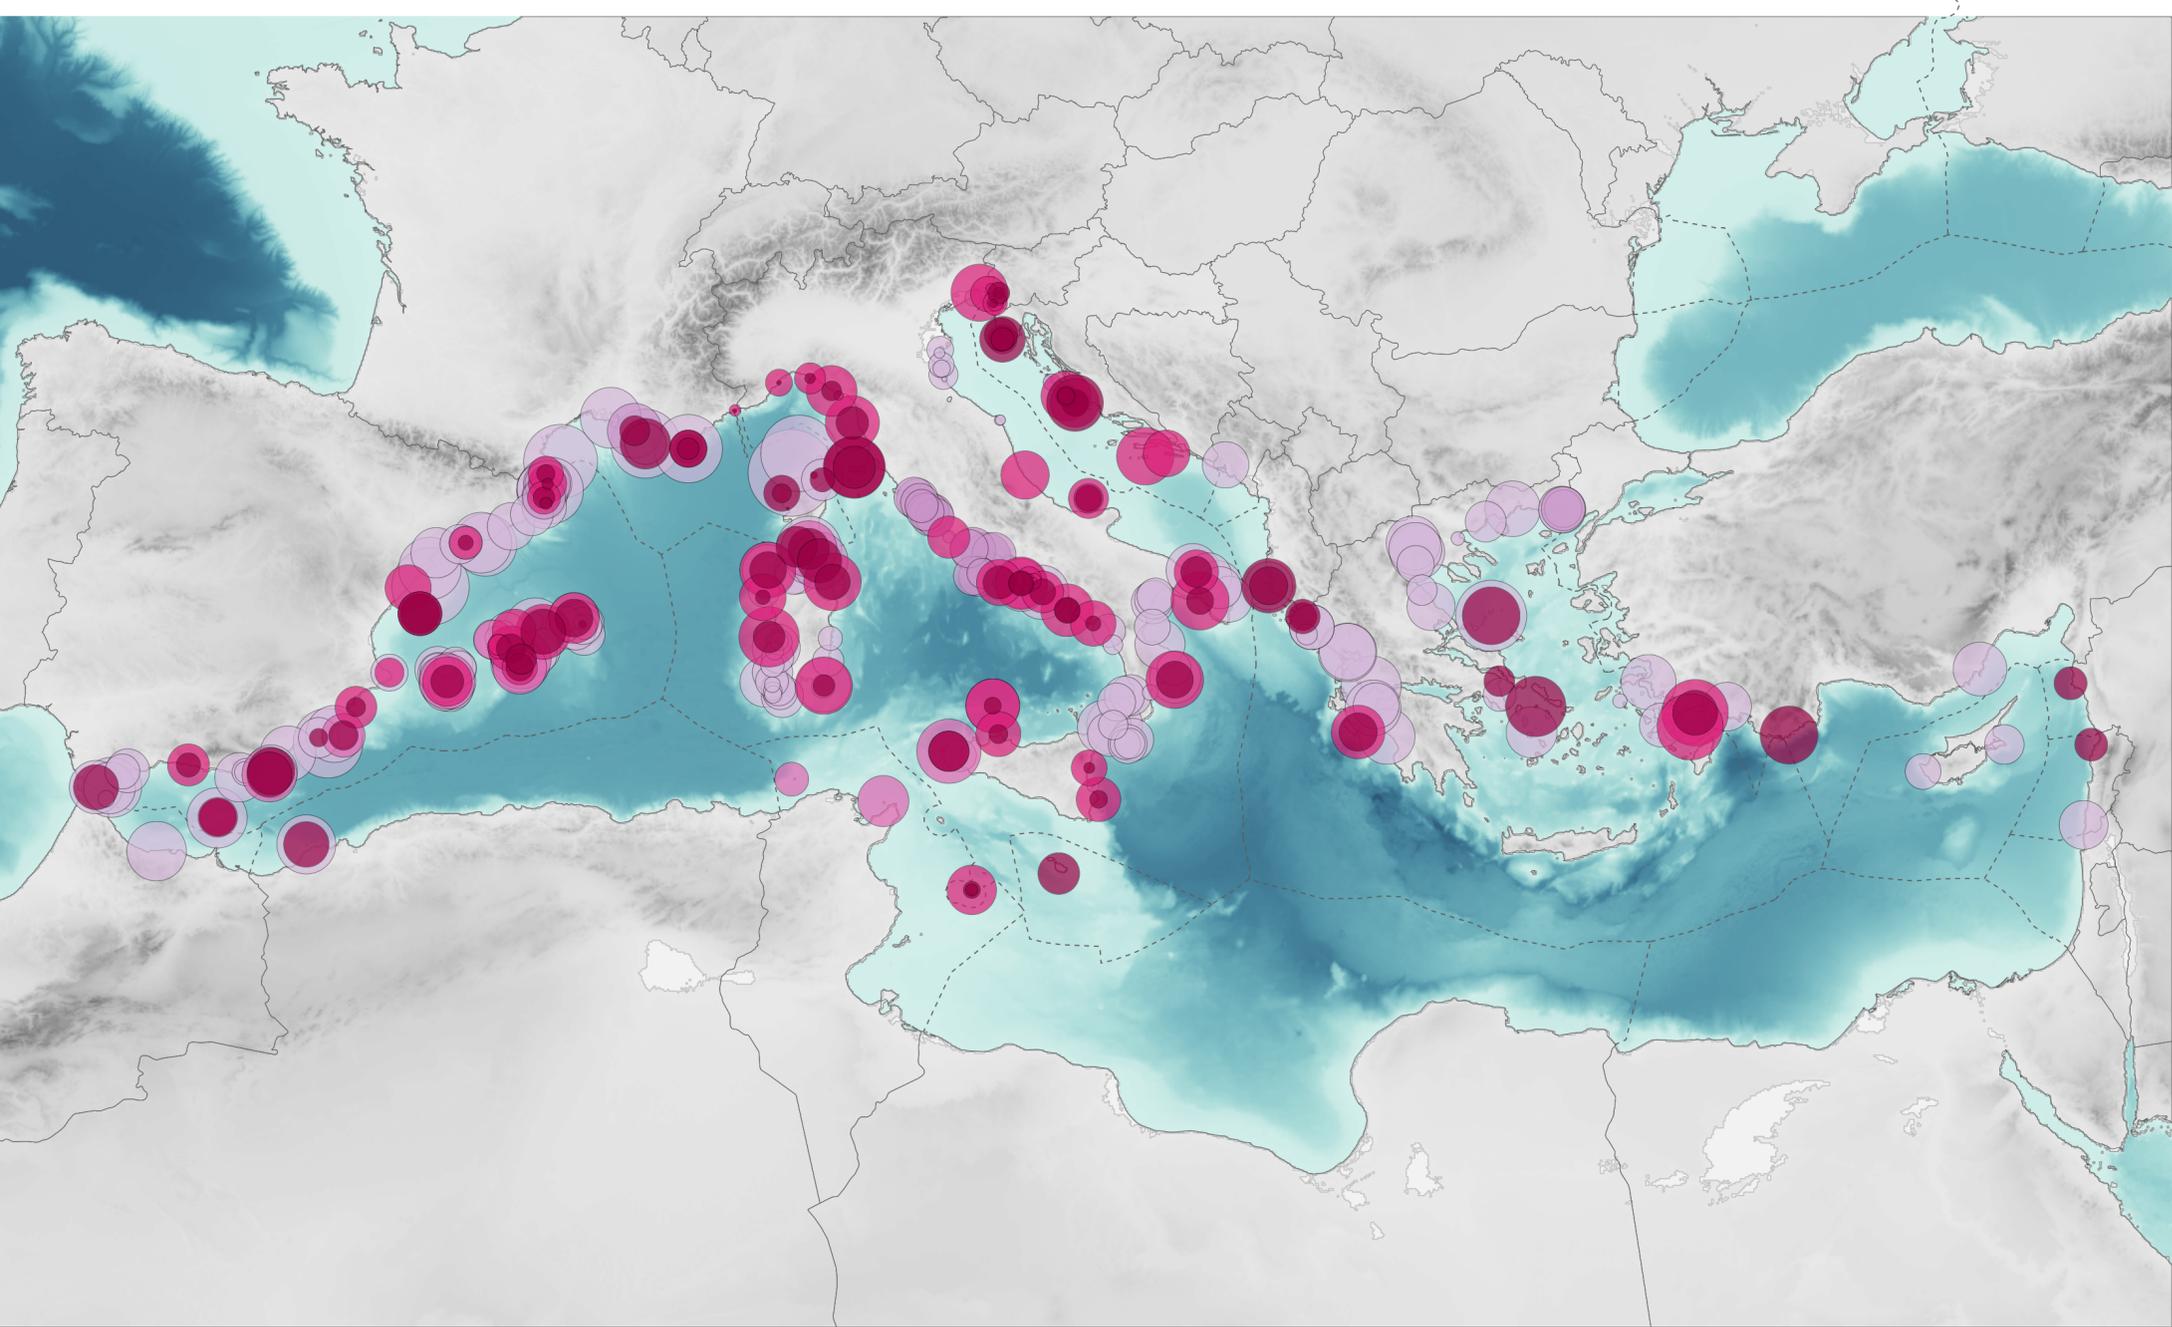

Highlights

- 6.01% of the Mediterranean is covered by protection
- In 95% of this area, regulations are not stronger inside than outside MPAs
- Only 0.23% of the Mediterranean is fully or highly protected
- Protection is unevenly distributed across political boundaries and eco-regions

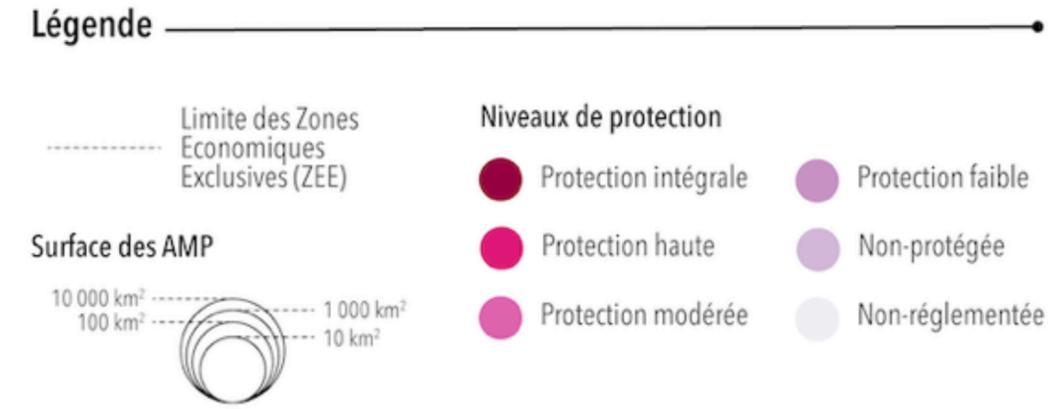

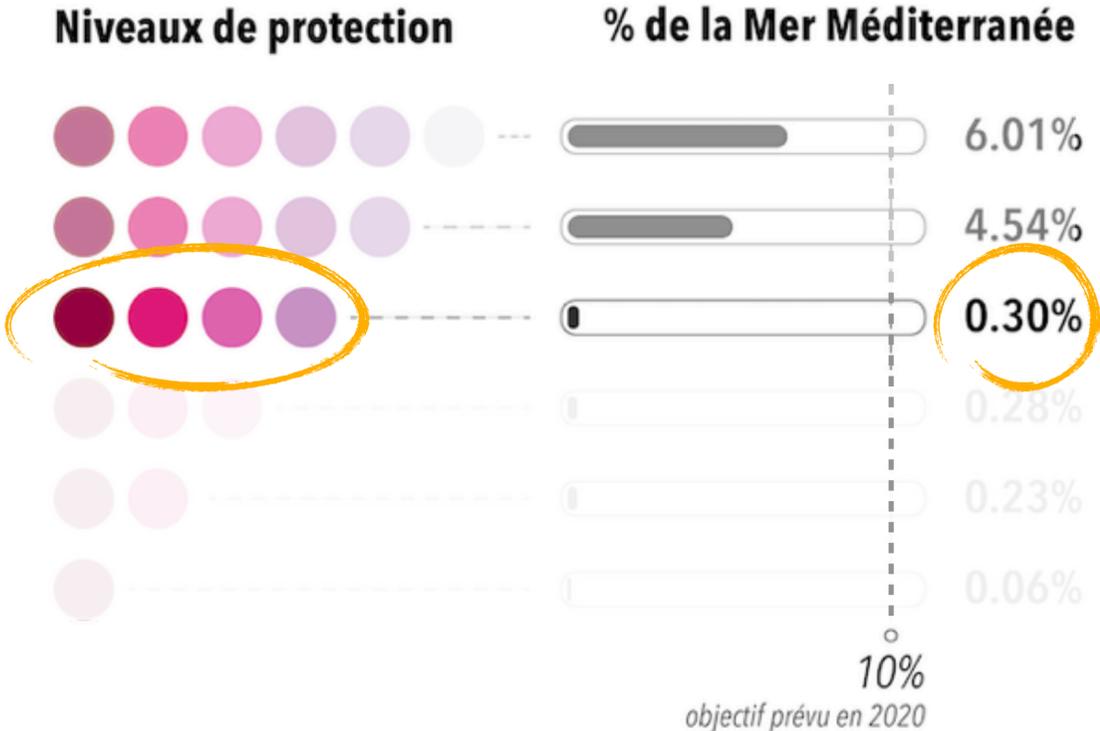

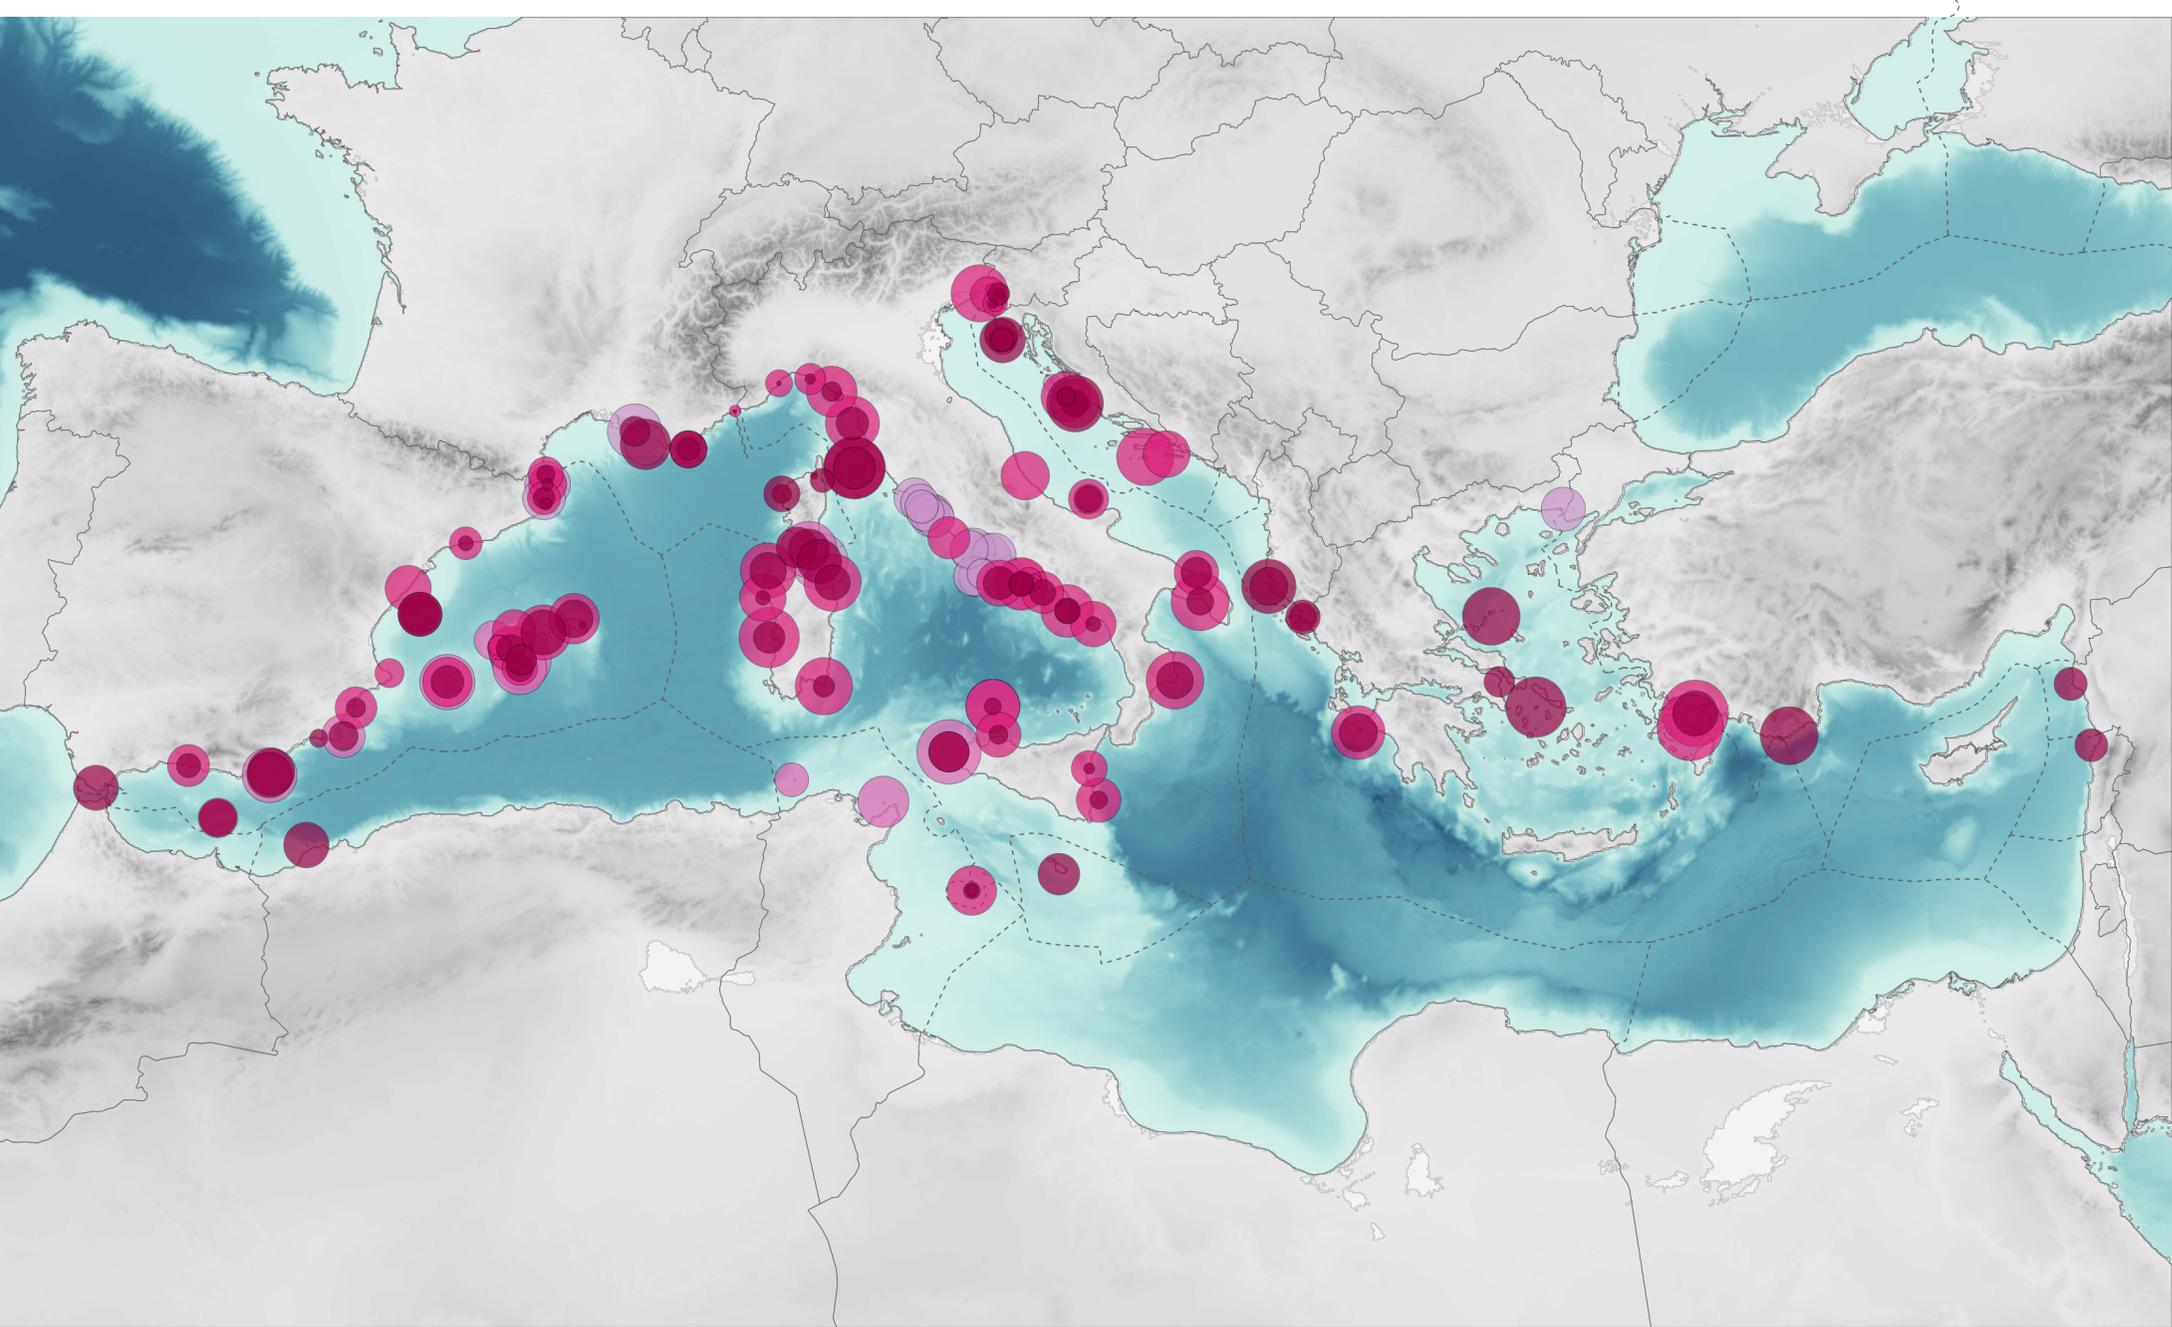

Levels of protection in Mediterranean MPAs

**How to
prioritize area
for strict
protection ?**

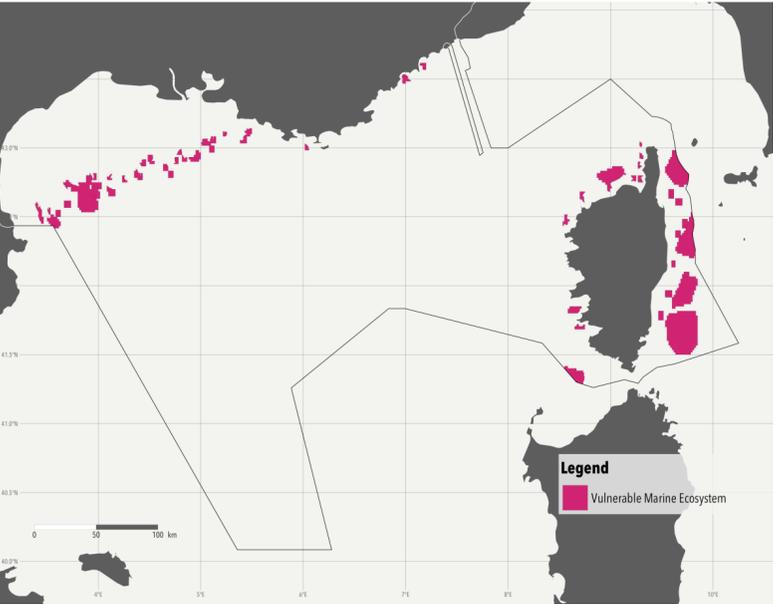

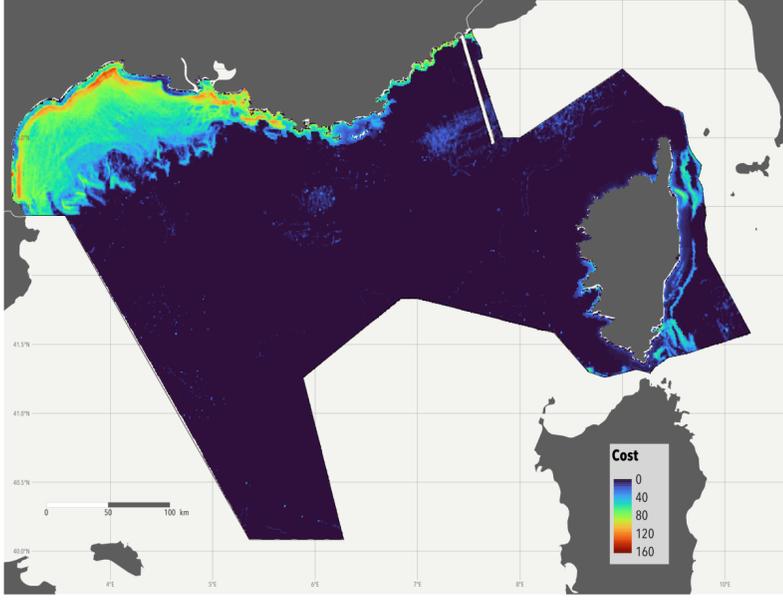

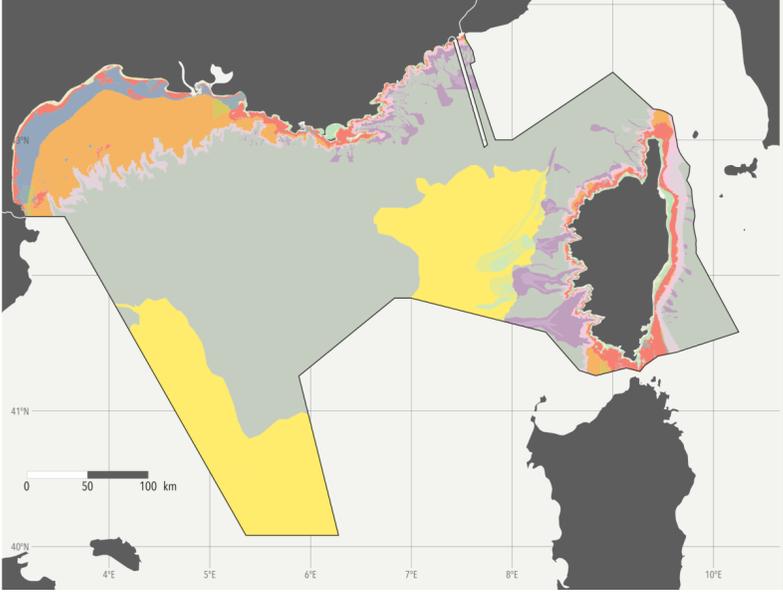

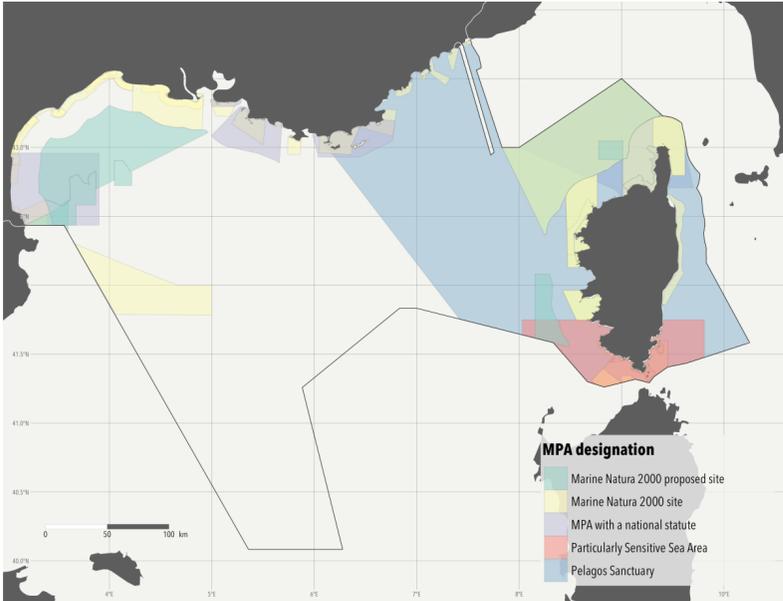

Systematic conservation planning approach for strict protection

Objectives and targets

Ecological features

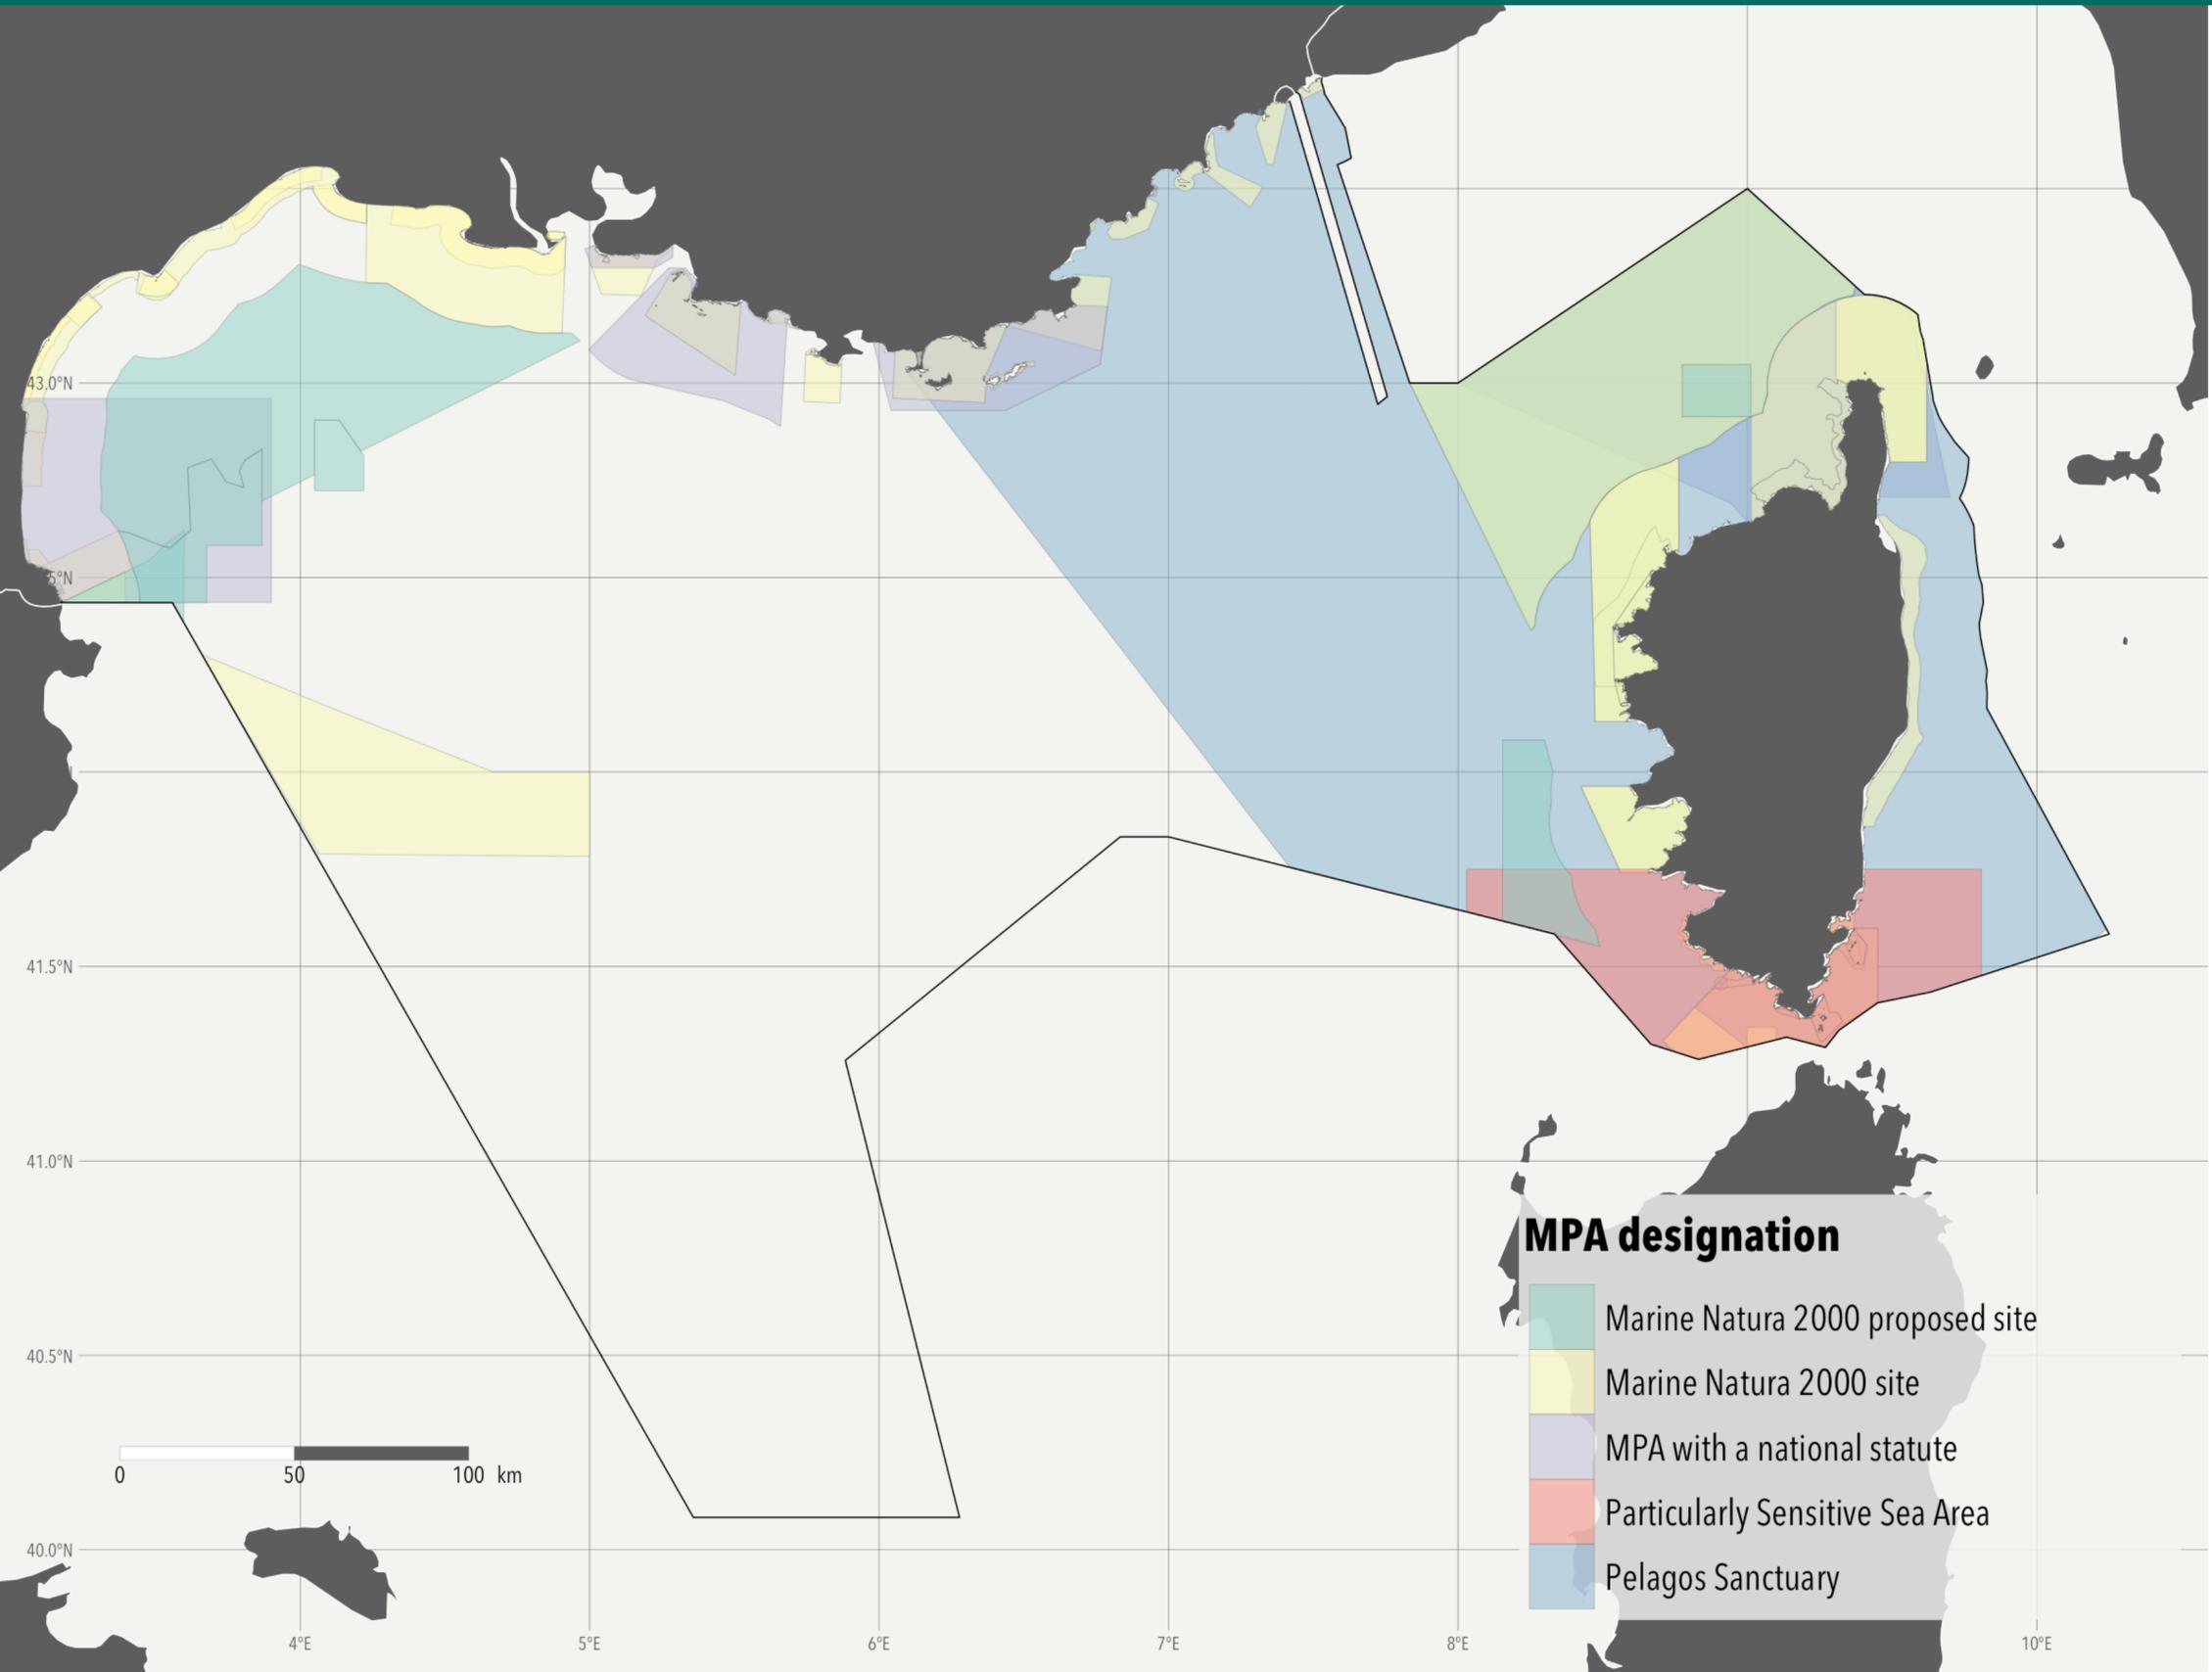

Cost

Constraints

10% of marine realm under strict protection by 2030 in a « functional, representative and ecologically coherent network ».

Objectives and targets

55%

of French waters in the Mediterranean Sea are under various protection statut

< 0.1%

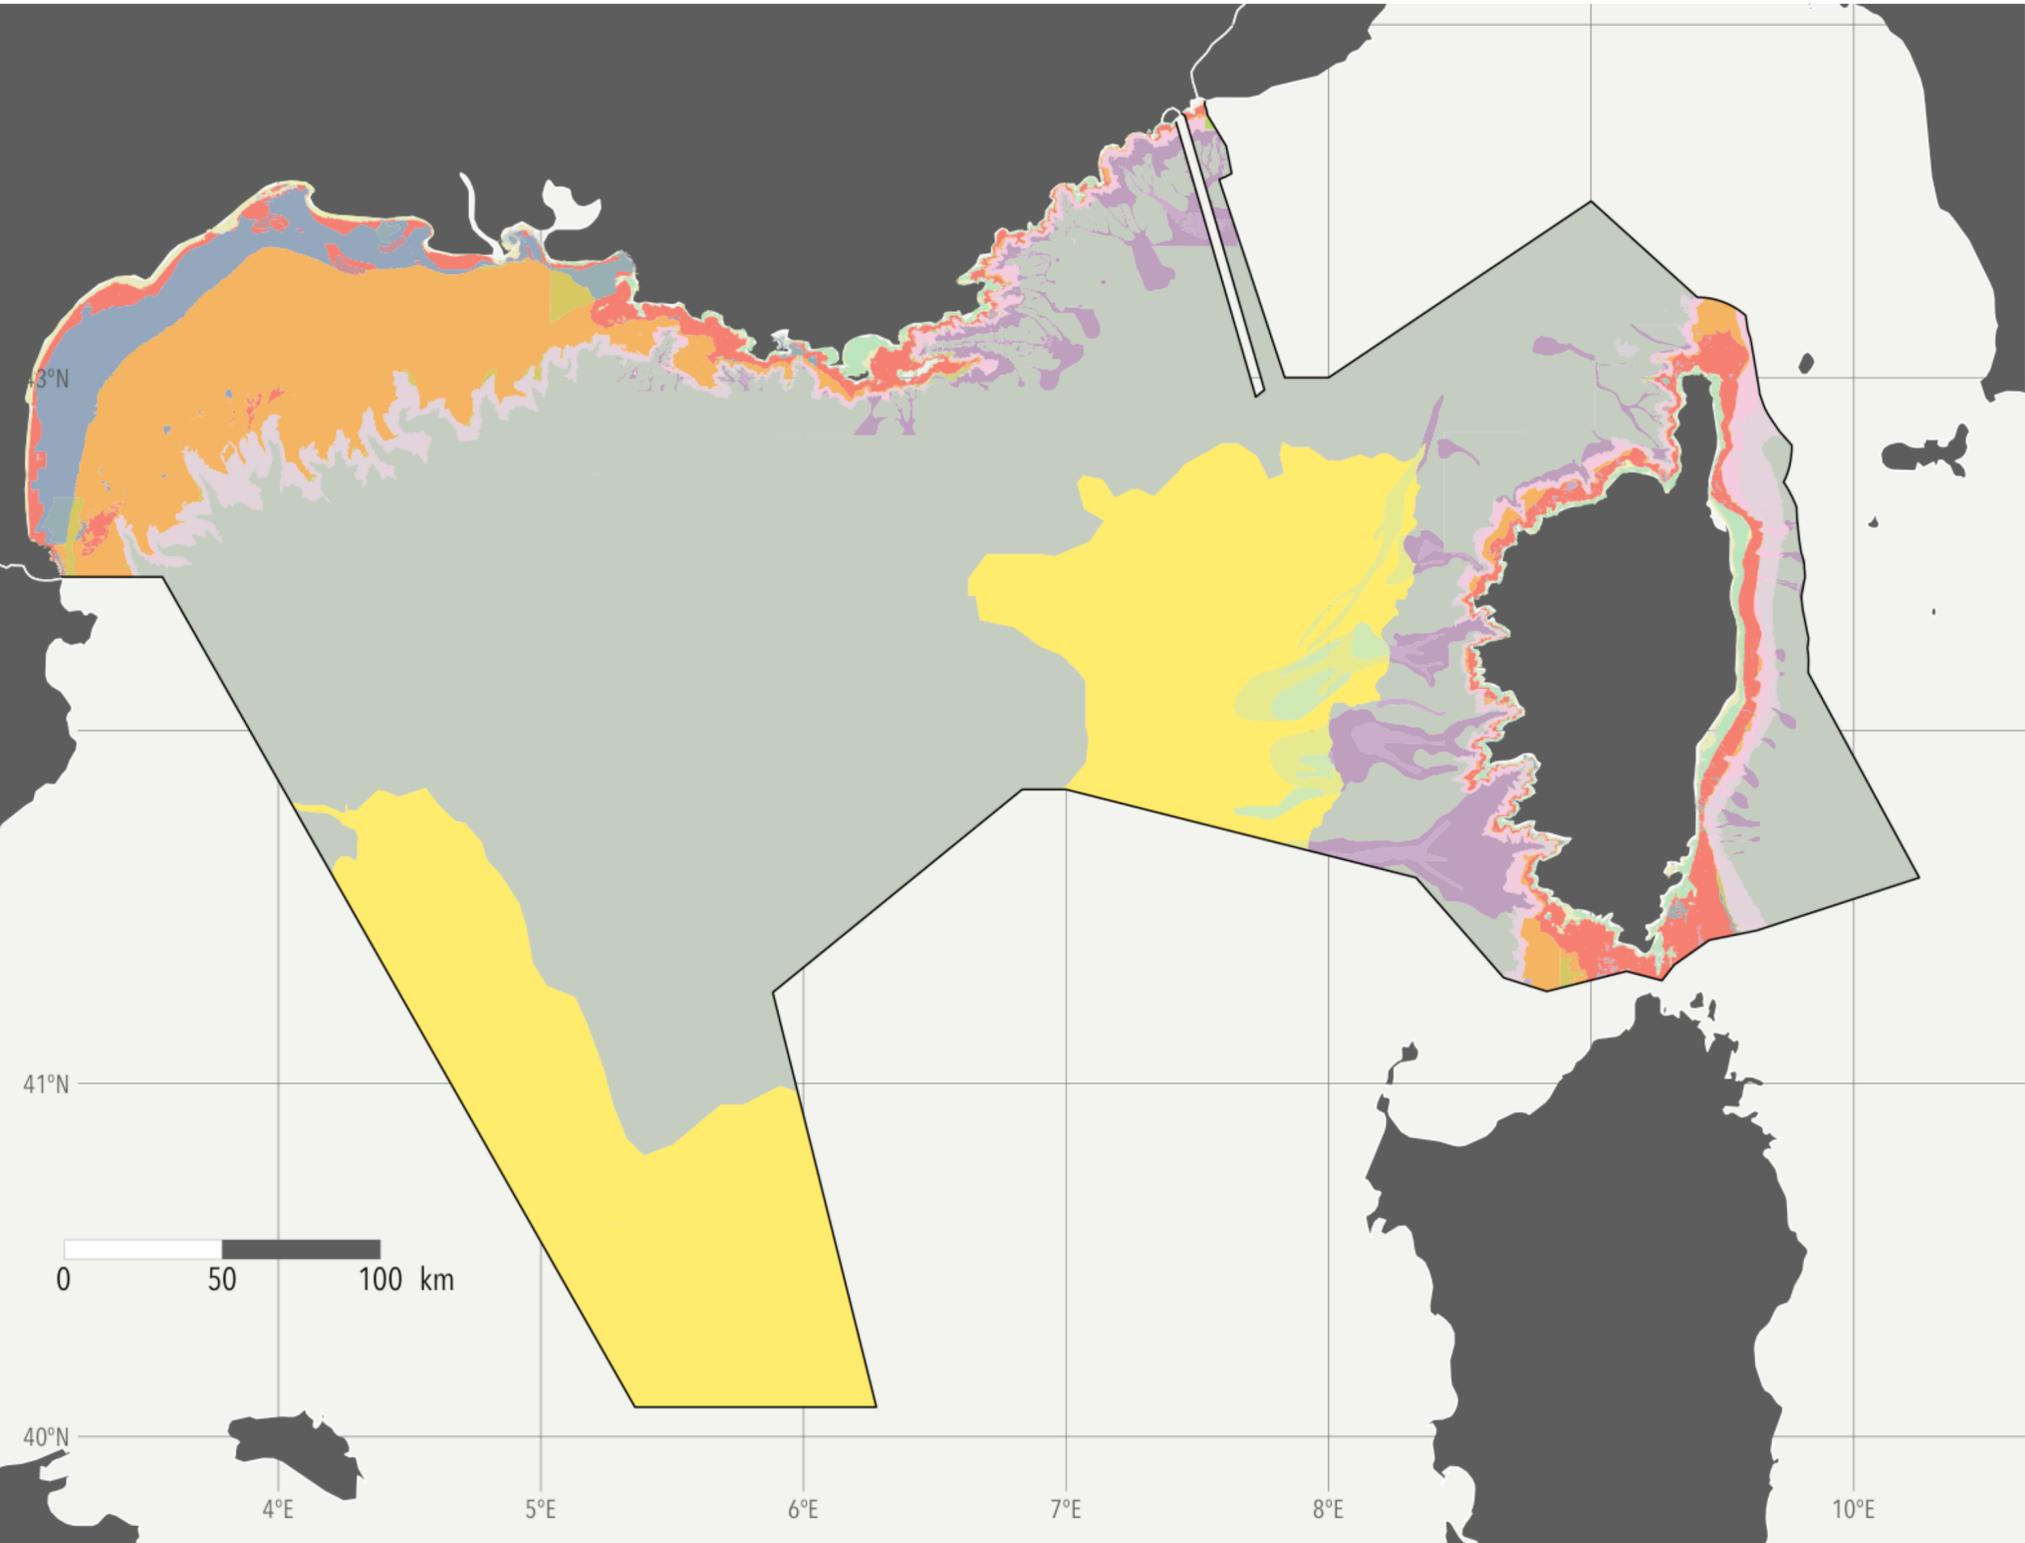

are fully protected

Objectives

30% in 2030 including 10% of strong protection (French version of strict protection), firstly to be settle in already existing MPAs in a coherent* way

* Representative, large enough, replicated, in network.

Ecological features: EUNIS habitats

EUNIS habitats

- MB15: Mediterranean infralittoral rock
- MB252: Biocenosis of [*Posidonia oceanica*]
- MB35: Mediterranean infralittoral coarse sediment
- MB55: Mediterranean infralittoral sand
- MB65: Mediterranean infralittoral mud
- MC151: Coralligenous biocenosis
- MC251: Coralligenous platforms
- MC35: Mediterranean circalittoral coarse sediment
- MC45: Mediterranean circalittoral mixed sediment
- MC451: Biocenosis of Mediterranean muddy detritic bottoms
- MC651: Biocenosis of Mediterranean circalittoral coastal terrigenous muds
- MD151: Biocenosis of Mediterranean shelf-edge rock
- MD451: Biocenosis of Mediterranean open-sea detritic bottoms on shelf-edge
- MD651: Biocenosis of Mediterranean offshore circalittoral coastal terrigenous muds
- ME15: Mediterranean upper bathyal rock
- ME35: Mediterranean upper bathyal coarse sediment
- ME45: Mediterranean upper bathyal mixed sediment
- ME55: Mediterranean upper bathyal sand
- ME65: Mediterranean upper bathyal mud
- MF15: Mediterranean lower bathyal rock
- MF35: Mediterranean lower bathyal coarse sediment
- MF45: Mediterranean lower bathyal mixed sediment
- MF55: Mediterranean lower bathyal sand
- MF65: Mediterranean lower bathyal mud
- MG35: Mediterranean abyssal coarse sediment
- MG55: Mediterranean abyssal sand
- MG65: Mediterranean abyssal mud

Ecological features: Vulnerable Marine Ecosystems

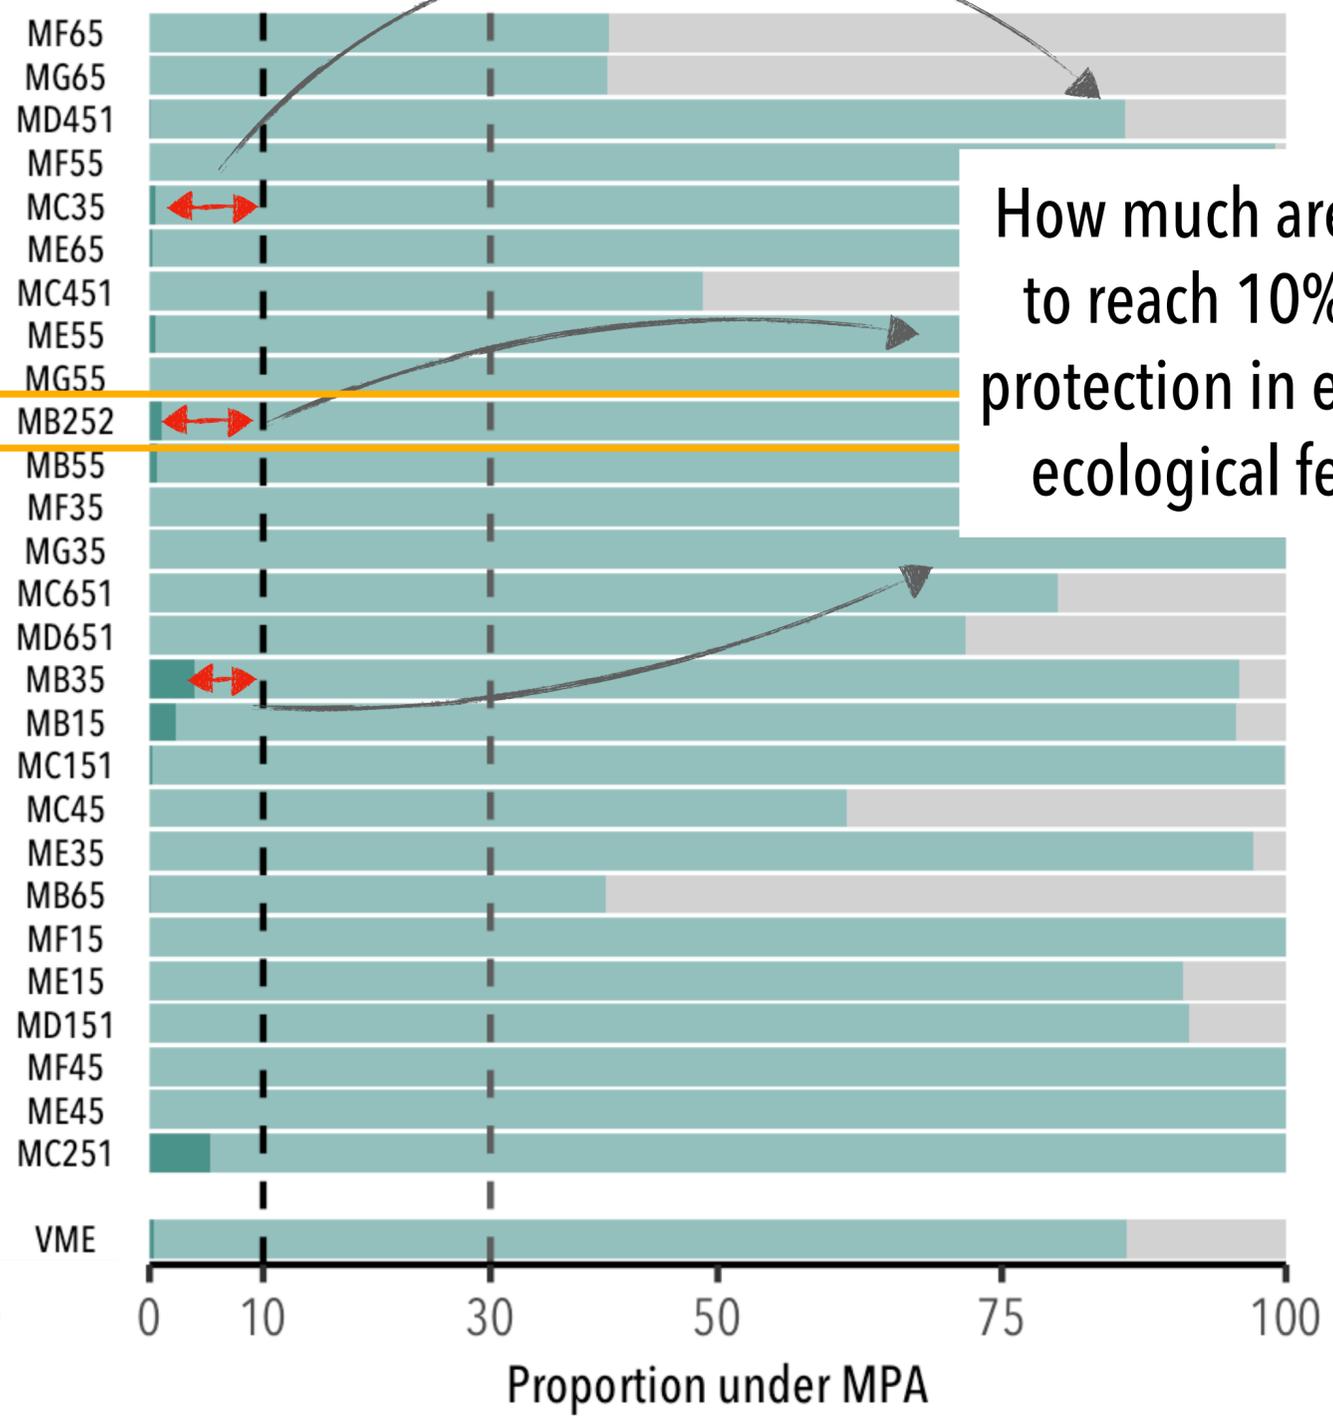

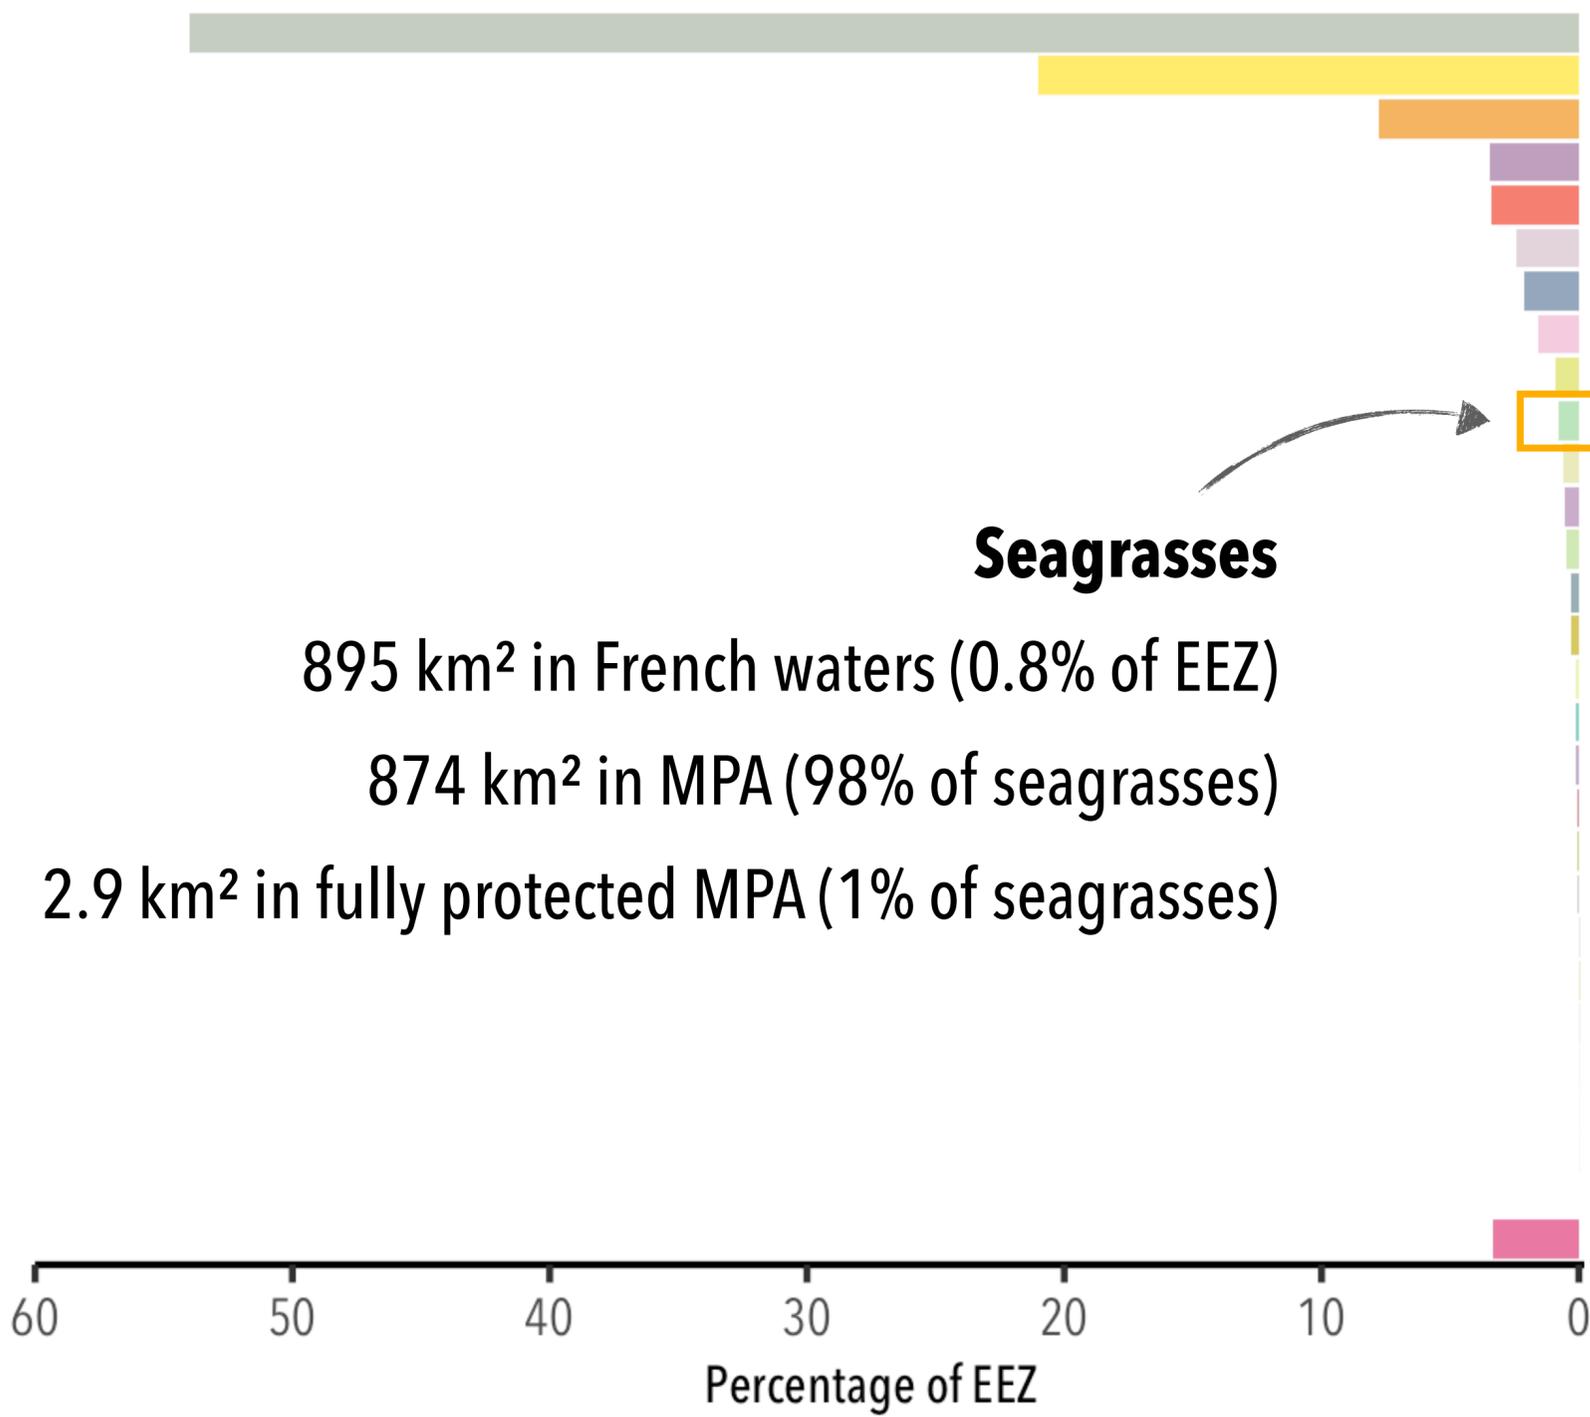

VME are designated according to one or more of these criteria:

- Uniqueness
- Functional significance
- Fragility
- Low recovery
- Structural complexity

FAO 2009

In the Mediterranean Sea, mainly composed of cold-water coral reefs, and deep-sea sponge aggregations

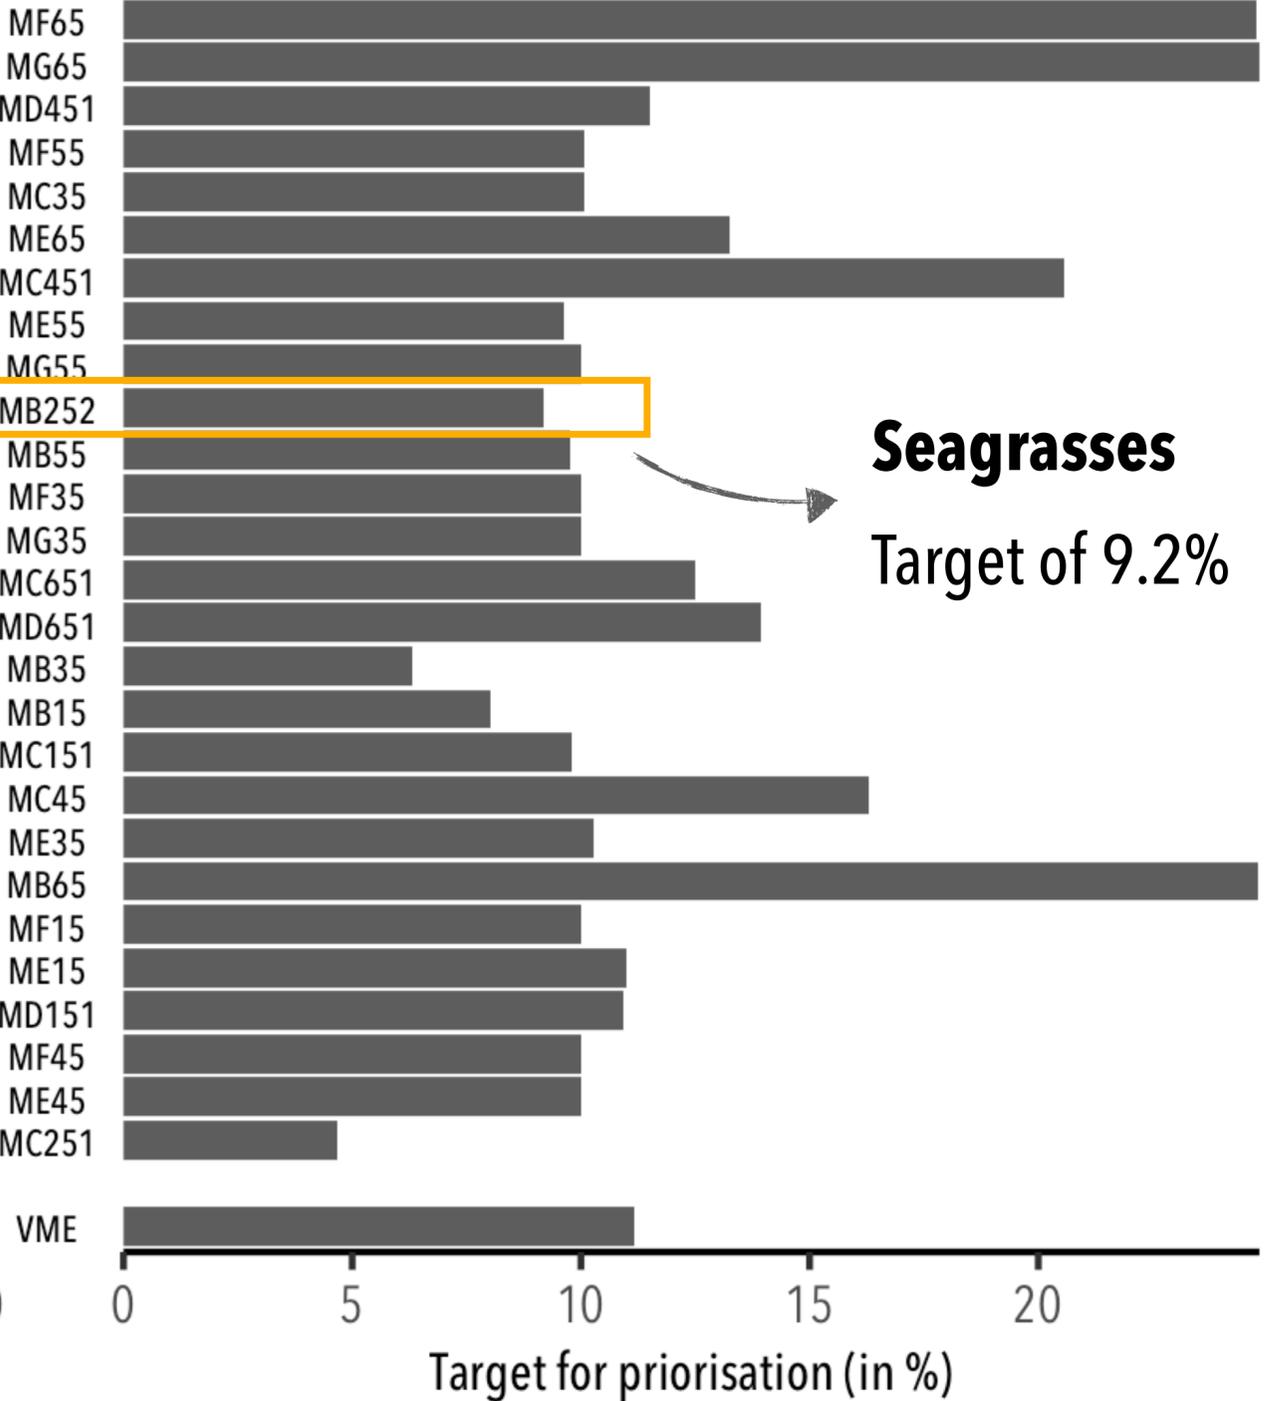

Ecological features: setting targets

How much area remain to reach 10% of strict protection in each of our ecological features ?

Legend Unprotected Protected Fully protected

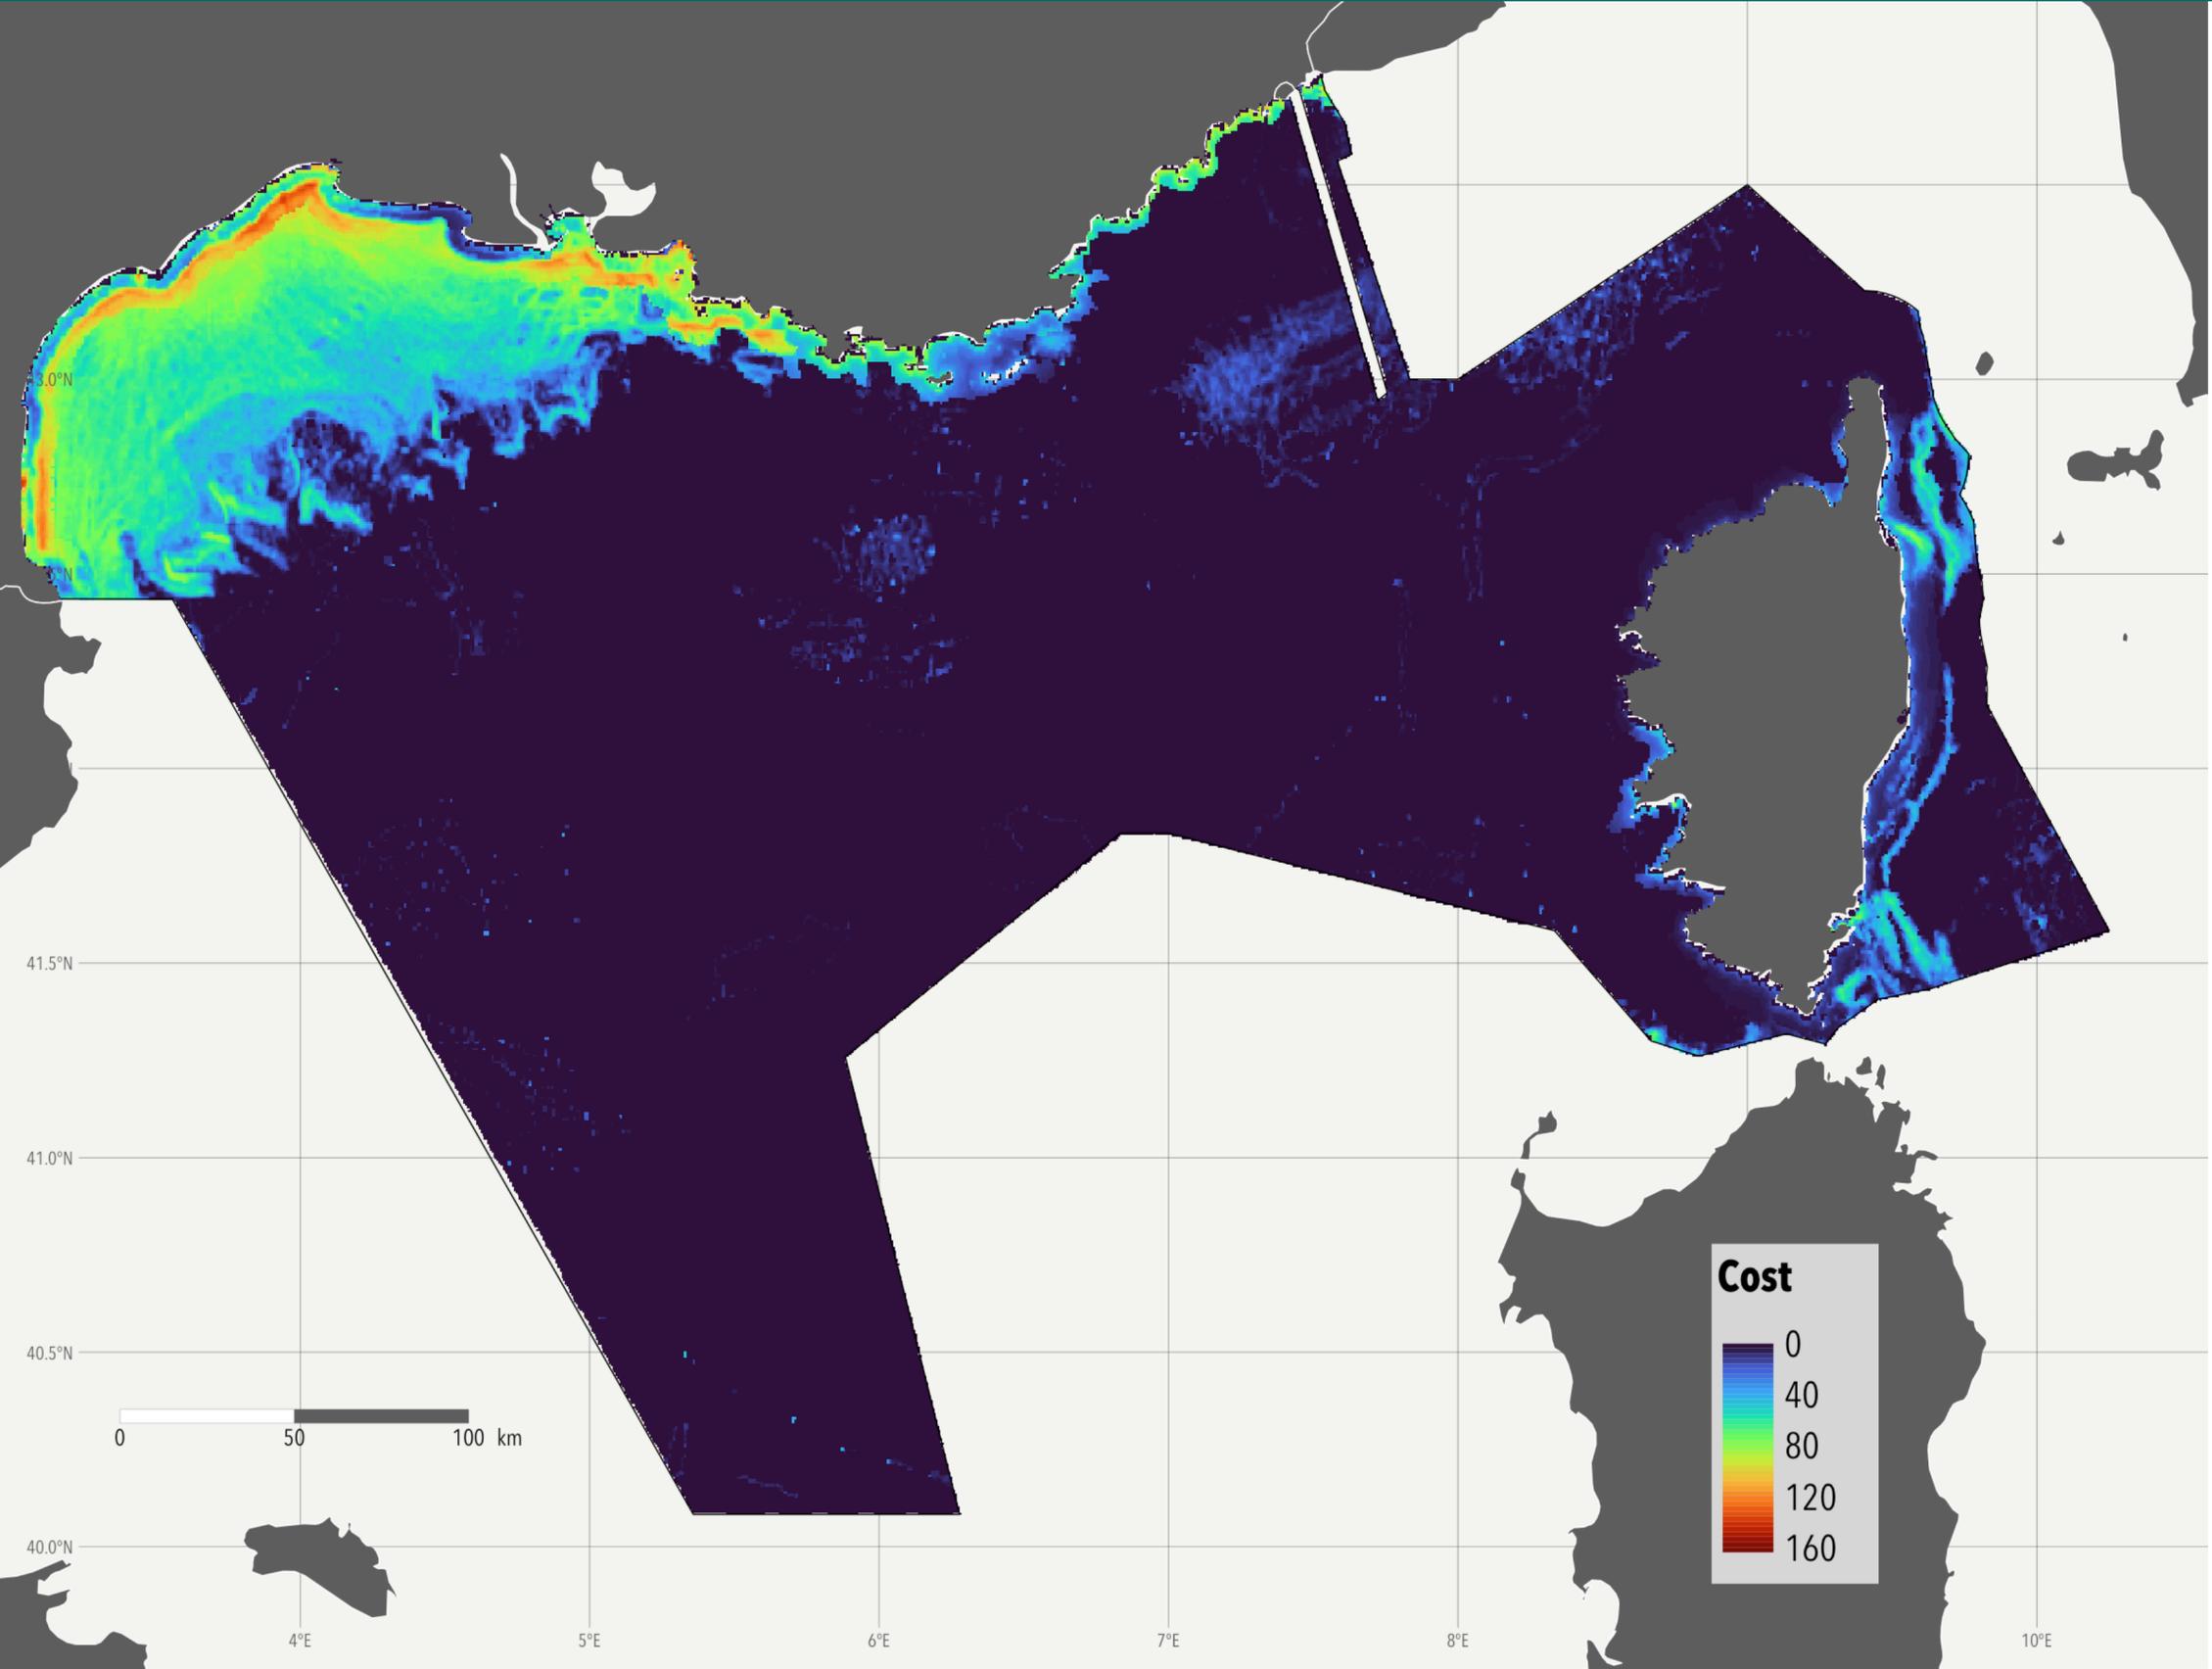

Ecological features: setting targets

Legend Unprotected Protected Fully protected

Meaning the percentage of each ecological features inside MPAs that are required to reach 10% of each under strict protection

Conservation cost: distribution and intensity of fishing activities

Coastal fisheries

Data based on catch

From Halpern et al. 2008 - Watson et al. 2018

Offshore fisheries

Data based on AIS

From GlobalFishingWatch

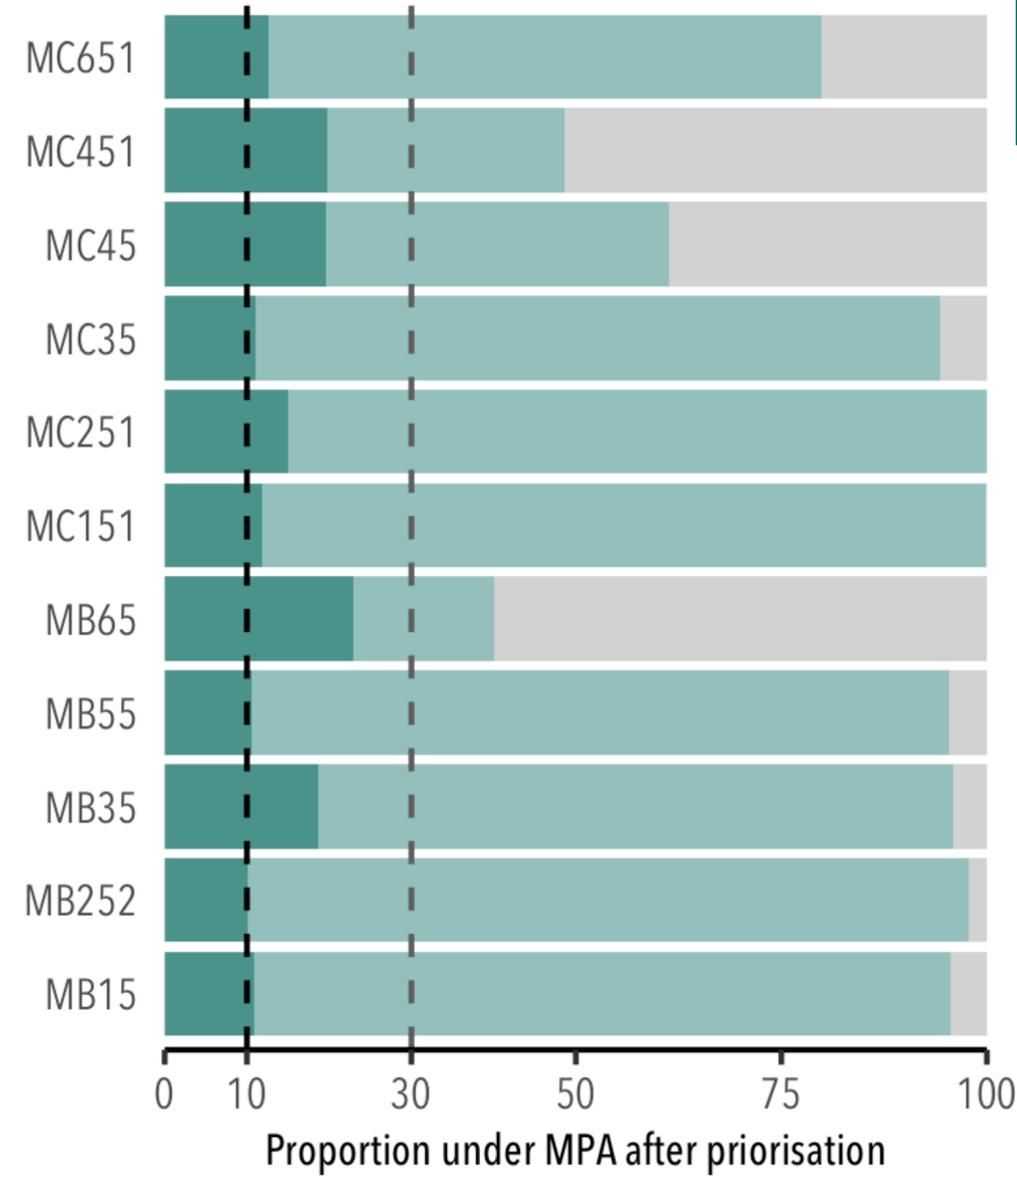

Constraints: ensure to prioritize area already fully protected

Constraints: ensure to not prioritize wind-farm projects

Preliminary results of the prioritisation for coastal habitats

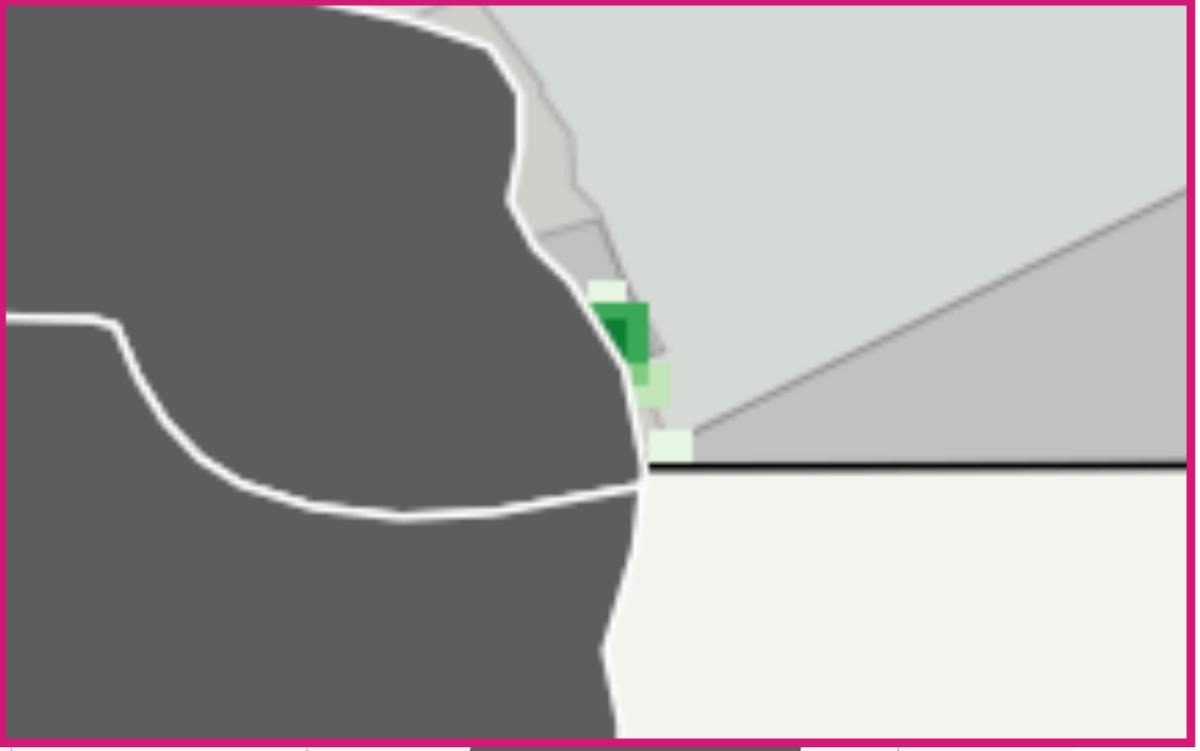

Cost of the prioritisation

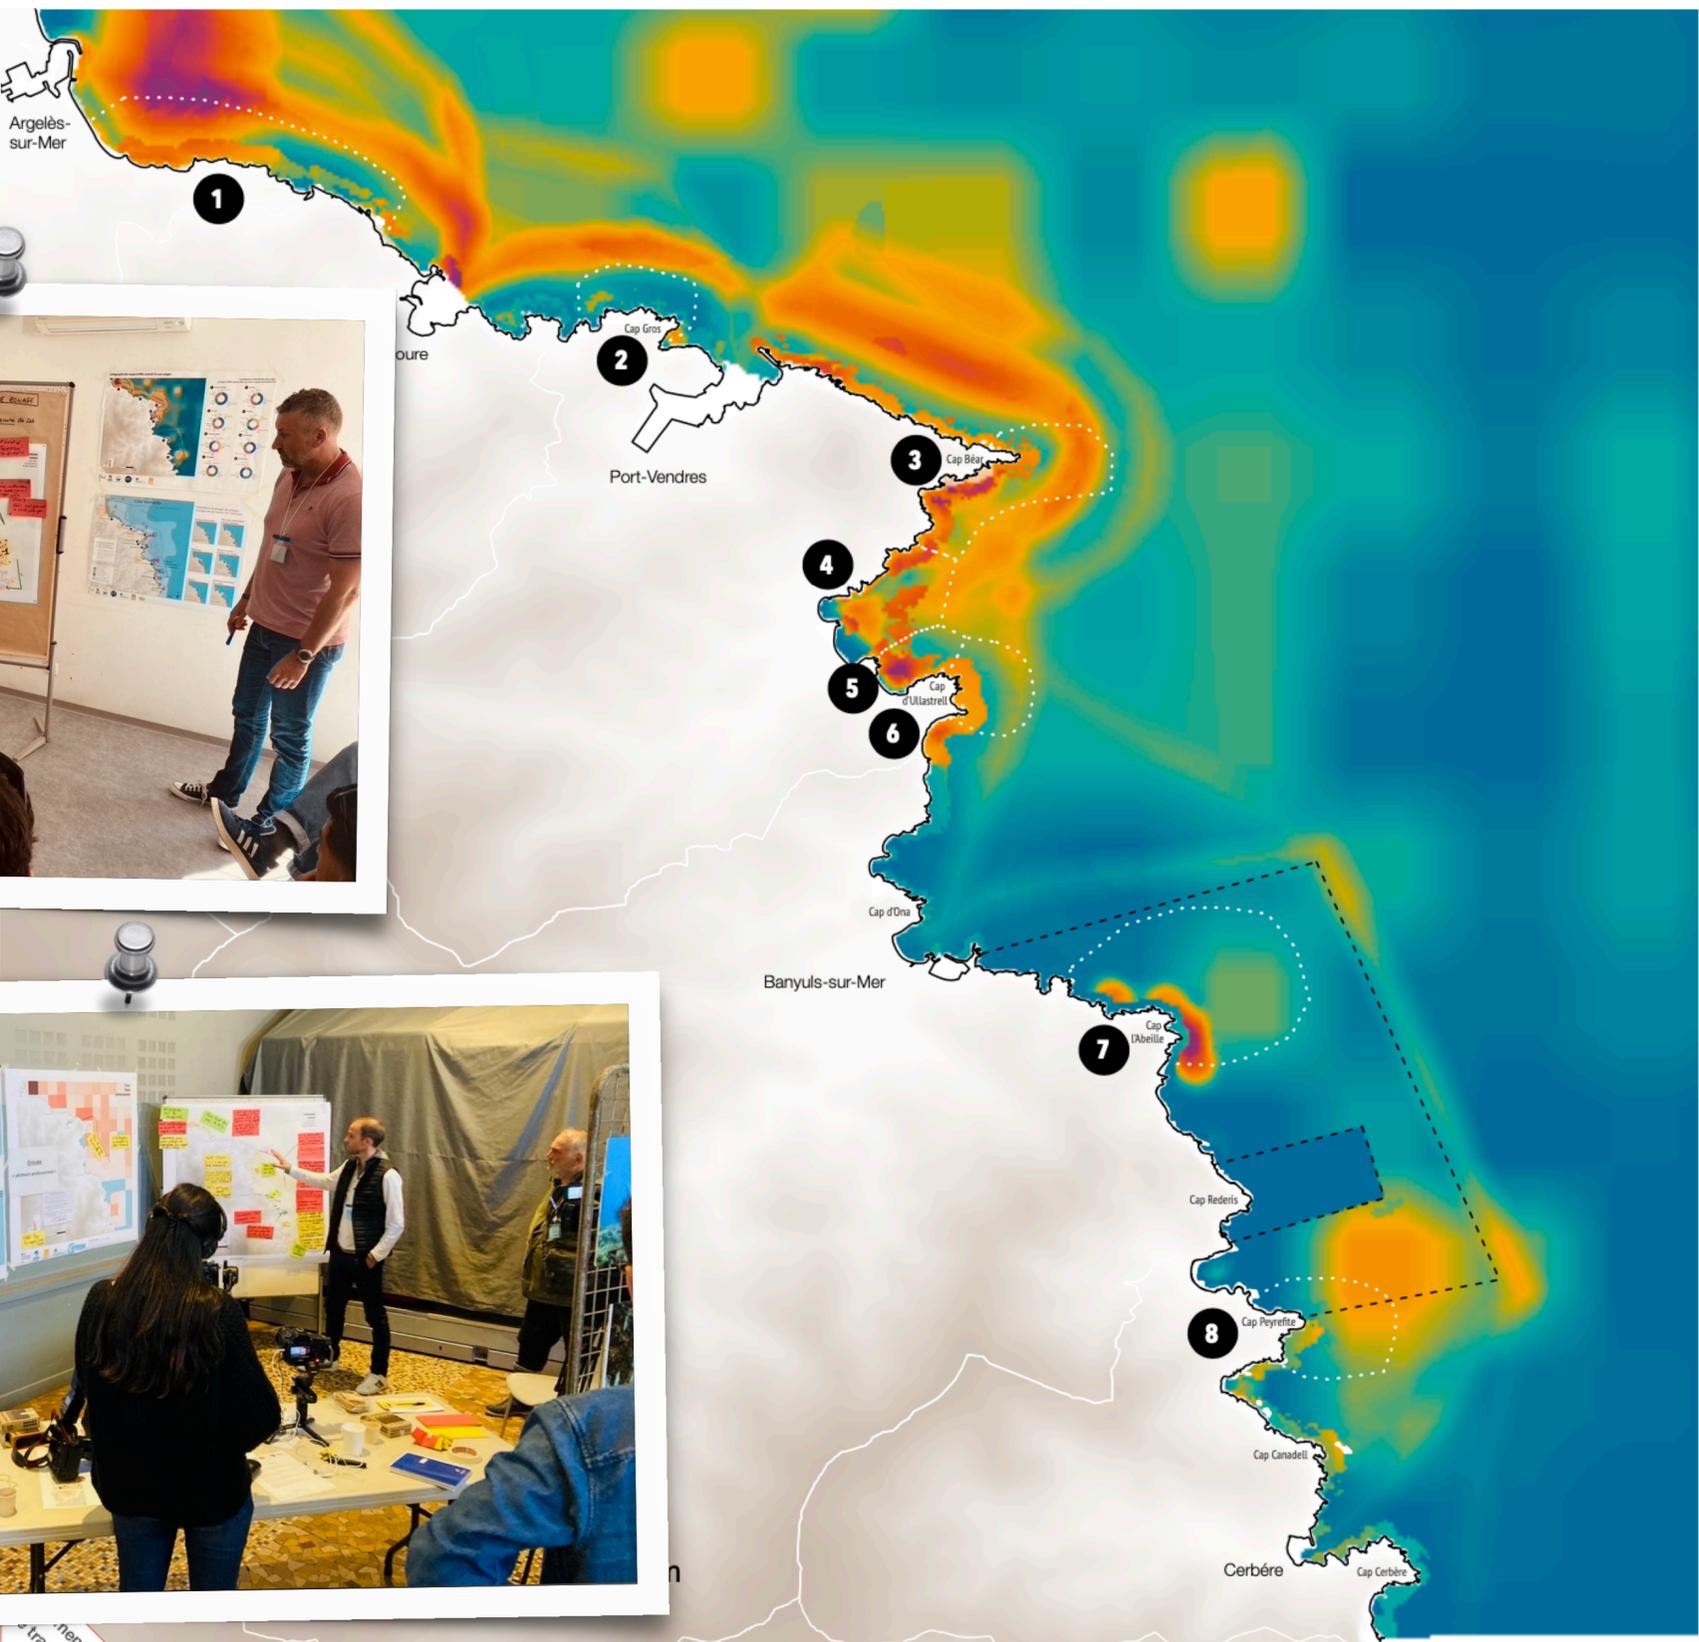

8%*

* meaning 8% of the total cost relative to fishing effort is impacted by the prioritisation

The case of the Natural Reserve Marine of Cerbère-Banyuls

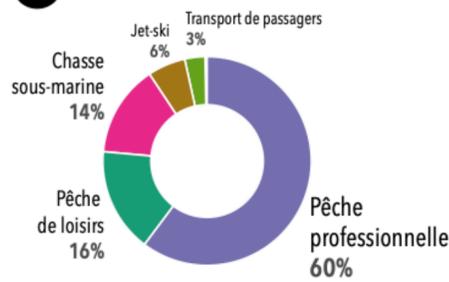

Cumulative impact assessment as a tool to prioritize management measures

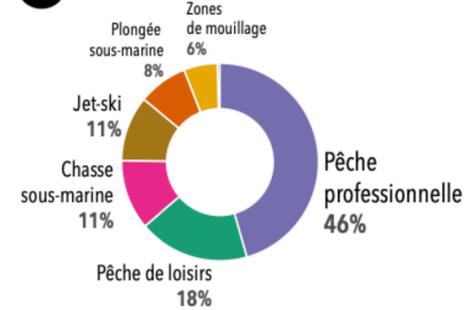

Contributions individuelles des usages au risque d'effet cumulé dans les zones à enjeux de biodiversité
